General Purpose Water Accounting Report for the Murrumbidgee Catchment 2021–22

Acknowledgement of Country

The Department of Planning and Environment acknowledges Aboriginal people as Australia's First Peoples practicing the oldest living culture on earth and as the Traditional Owners and Custodians of the lands and waters on which we rely.

We acknowledge the people of the Barapa Barapa, Mutthi Mutthi, Nari Nari, Nyeri Nyeri, Wadi Wadi, Wolgalu, Wemba Wemba, Weki Weki and Wiradjuri Nations hold the land and waters of the Murrumbidgee River catchment area is of spiritual, cultural, customary and economic importance.

We recognise the intrinsic connection of Traditional Owners to Country and acknowledge their contribution to the management of the Murrumbidgee River catchment landscape and natural resources.

Abbreviations

Abbreviation/acronym	Description
ARCGIS	mapping and spatial analysis platform for designing and managing solutions through the application of geographic knowledge
AWAS 1	Australian Water Accounting Standard 1
AWD	available water determination
BoM	Bureau of Meteorology
CAIRO	computer-aided improvements to river operations
DRB	Daily release balance
ECA	environmental contingency allowance
GIS	geographic information system
GPWAR	general purpose water accounting report
IQQM	integrated quantity and quality model
MDBA	Murray–Darling Basin Authority
ML	megalitres (1,000,000 litres)
ML/d	megalitres per day
MODFLOW	modular, three-dimensional, finite-difference groundwater flow model
PSV	Provisional storage volume
SILO	climatic data provision system run by the Queensland Government for the provision of both measured and modelled data
WAS	Water accounting system
WASB	Water Accounting Standards Board
WaterNSW	WaterNSW is a New South Wales Government–owned statutory corporation that is responsible for supplying the state’s bulk water needs, and operating the state’s river systems and dams
WLS	Water licencing system
WSP	water sharing plan

Glossary

Term	Meaning
allocation	the specific volume of water allocated to water allocation accounts in each season, defined according to rules established in the relevant water plan
allocation assignments	the transfer of water between licence holder allocation accounts as a result of a trade agreement The assignment becomes part of the receiver's current year allocation account water.
allocation account	water account attached to an access licence used to track the balance of account water
available water determination (AWD)	the process by which water is made available for use and shared amongst water users who hold a water access licence It determines the volume of water that is to be added to an individual's licence allocation account.
Australian Water Accounting Standard (AWAS)	a national standard that prescribes the basis for preparing and presenting a general-purpose water accounting report (GPWAR) It sets out requirements for the recognition, quantification, presentation and disclosure of items in a GPWAR.
back-calculation	a calculation approach using a mass balance to determine an unknown variable (used to calculate storage inflows based on balancing the change in storage volume where inflow is the only unknown)
basic rights	the non-licensed right to extract water to meet basic requirements for household purposes (non-commercial uses in and around the house and garden) and for watering of stock It is available for anyone who has access to river frontage on their property.
computer-aided improvements to river operations (CAIRO)	a spreadsheet-based water balance model used for optimising river operations (orders and releases)
carryover	the volume or share component that may be reserved by a licence holder for use in the subsequent year
catchment	the areas of land that collect rainfall and contribute to surface water (streams, rivers, wetlands) or to groundwater A catchment is a natural drainage area, bounded by sloping ground, hills or mountains, from which water flows to a low point.
dead storage	the volume in storage that is generally considered unavailable for use (e.g. water level below release valves) due to access and often poor water quality
effective storage	the total volume of storage minus the dead storage component – the volume generally considered as useable
effluent	flow leaving a place or process Sewage effluent refers to the flow leaving a sewage treatment plant. An effluent stream is one which leaves the main river and does not return.
entity	a defined geographical area or zone within the accounting region Transactions and reports are produced for each entity.

Term	Meaning
end of system	the last defined point in a catchment where water information can be measured and/or reported
environmental water	water allocated to support environmental outcomes and other public benefits Environmental water provisions recognise the environmental water requirements and are based on environmental, social and economic considerations, including existing user rights.
evaporation	the process by which water or another liquid becomes a gas Water from land areas, bodies of water, and all other moist surfaces is absorbed into the atmosphere as a vapour.
evapotranspiration	the process by which water is transmitted as a vapour to the atmosphere as the result of evaporation from any surface and transpiration from plants
extraction	the pumping or diverting of water from a river or aquifer by licensed users for a specific purpose (irrigation, stock, domestic, towns, etc.) The volume is measured at the point of extraction or diversion (river pump, diversion works, etc.).
general purpose water accounting report (GPWAR)	a report prepared according to the Australian Water Accounting Standard It comprises several components including a contextual statement, a statement of water assets and water liabilities, a statement of change in water assets and water liabilities, a statement of physical water flows, notes and disclosures, and an assurance and accountability statement.
general-security licence	a category of water access licence implemented under the <i>Water Management Act 2000</i> This forms the bulk of the water access licence entitlement volume in NSW and is a low-priority entitlement (i.e. it only receives water once essential and high-security entitlements are met in the available water determination process).
groundwater	water location beneath the ground in soil pore spaces and in the fractures of rock formations
high-security licence	a category of water access licence implemented under the <i>Water Management Act 2000</i> It receives a higher priority than general-security licences but less priority than essential requirements in the available water determination process.
HYDSTRA database	a database used by NSW Department of Planning and Environment to store continuous, time-series data such as river flow, river height, and water quality
inflows	surface water runoff and deep drainage to groundwater (groundwater recharge) and transfers into the water system (both surface and groundwater) for a defined area
inter-valley trade	trade of licence holder allocation account water via allocation assignment from one catchment to another catchment (or state)
intra-valley trade	trade of licence holder allocation account water via allocation assignment within the same catchment
median	the middle point of a distribution, separating the highest half of a sample from the lowest half
non-physical transaction	an accounting transaction representing a process that is not a component of the water cycle (e.g. an available water determination)
physical transaction	an accounting transaction representing a process of the water cycle (e.g. an extraction)

Term	Meaning
regulated river	a river system where flow is controlled via one or more major man-made structures such as dams and weirs For the purposes of the <i>Water Management Act 2000</i> , a regulated river is one that is declared by the minister to be a regulated river. Within a regulated river system, licence holders can order water against a held entitlement.
share component	an entitlement to water specified on the access licence, expressed as a unit share or, in the case of specific purpose licences (e.g. local water utility, major water utility and domestic and stock), a volume in megalitres The amount of water a licence holder is allocated as a result of an available water determination and the amount they can take in any year is based on their share component.
storage	a state-owned dam, weir or other structure that is used to regulate and manage river flows in the catchment and the water bodies impounded by these structures
storage reserve	proportion of water in a storage reserved in the resource assessment process for future essential or high-security requirements (e.g. town water)
storage volume	the total volume of water held in storage at a specified time
supplementary water	unregulated river flow available for extraction under a supplementary licence
surface water	all water that occurs naturally above ground including rivers, lakes, reservoirs, creeks, wetlands and estuaries
tributary	a smaller river or stream that flows into a larger river or stream Usually, several smaller tributaries merge to form a river.
ungauged catchment	a catchment without a flow gauge to accurately record stream flows Modelled estimates must be used to approximate the contribution of ungauged catchments to the main river.
water accounting	the systematic process of identifying, recognising, quantifying, reporting, assuring and publishing information about water, the rights or other claims to that water, and the obligations against that water
water assets	the physical water held in storage, as well as any claims to water that are expected to increase the future water resource (e.g. external water entering the system through inter-valley trading)
water licencing system	Database system administered by WaterNSW to manage NSW licence water licences, approvals and associated dealings
water liabilities	claims on the water assets of the water report entity, including water that has been allocated to licence holder accounts or environmental accounts, yet to be taken at the end of the reporting period
water sharing plan	a water management plan that defines the rules for sharing of water within a region under the <i>Water Management Act 2000</i>

Director's foreword

This is the 13th annual release of the general-purpose water accounting report (GPWAR) for the Murrumbidgee Regulated River Water Source. It has been prepared for the accounting period 1 July 2021 to 30 June 2022 (the reporting period), under the Australian Water Accounting Standard 1 (WASB, 2012).

The GPWAR provides stakeholders with a consolidated, comparable and publicly accessible set of water accounting information for the water source. The information presented is also used internally for a range of water planning functions and legislative reporting obligations.

Included in the GPWAR are

- a contextual statement summarising the climatic conditions, water resources, environmental holdings, water trading market and water resource management in the water source for the reporting period
- a physical flow diagram illustrating changes in storage volumes and the associated inflows and outflows
- water accounting statements presenting the opening and closing balances, and itemised changes to these balances for available water resources (water assets), licenced allocation accounts (water liabilities) and planned environmental water accounts (water liabilities)
- disclosure notes (linked to the figures within the water accounting statements) providing detailed information of accounting components including:
 - access licence account balances
 - planned and held environmental water account balances
 - a detailed available water determination report
 - temporary trading by licence category
 - supplementary announcements and usage by river reach
 - physical inflows and outflows to the system for the water year.

While groundwater has not been directly included in this GPWAR (aside from those processes that directly affect the regulated river), annual groundwater summary reports by water source are published separately and accessible via the department's website at www.industry.nsw.gov.au/water

As Director Water Analytics, NSW Department of Planning and Environment, I declare:

- the information presented in these accounts as a faithful representation of the management and operation of the Murrumbidgee Regulated River Water Source for the reporting period
- all data presented in this report is based on the best available information at the time of publication
- NSW Department of Planning and Environment has, to the best of its ability, prepared this GPWAR in accordance with the Australian Water Accounting Standard 1.

Danielle Baker

Director Water Analytics

NSW Department of Planning and Environment

Contextual statement

The Murrumbidgee catchment covers 84,000 square kilometres of southern New South Wales. It is bordered by the Great Dividing Range to the east, the Lachlan catchment to the north and the Murray catchment to the south.

The Murrumbidgee River spans almost 1,600 kilometres, rising in the Monaro Plains near Cooma and flowing westward towards its junction with the Murray River near Balranald. The climate is extremely diverse ranging from alpine conditions in the Snowy Mountains where elevations are over 2,200 metres to semi-arid conditions on the Riverina plains where elevations are less than 50 metres.

The Murrumbidgee River is regulated by Burrinjuck Dam located near Yass at the junction of the Yass and Goodradigbee Rivers. The valley also receives water from the Snowy Mountains Scheme which is stored in Blowering Dam on the Tumut River. Downstream of Narrandera the major effluent of Yanco Creek leaves the river, feeding a series of regulated creeks that flow southwest to eventually join the Murray River. The lower end of the Murrumbidgee River is known as the Lowbidgee, a broad floodplain where the river degrades into a complex area of effluent channels and swamps.

The Murrumbidgee River flows through lands previously occupied by the Wiradjuri people, the largest Aboriginal nation in NSW. Today the Murrumbidgee catchment supports a population of approximately 520,000 people. It includes the Australian Capital Territory and national capital Canberra (314,000 people) and Wagga Wagga, the largest inland city in NSW (57,000 people). The catchment also supports numerous regional cities and towns including Cooma, Tumut, Narrandera, Griffith, Leeton, Hay and Balranald.

Major irrigation districts have developed around Griffith, Leeton and Coleambally producing fruit, vegetables, wine, cotton and rice. Water is delivered to these areas from the river through offtakes at Berembed and Gogeldrie Weirs. Outside of these areas, the dominant agricultural land uses are grazing and dryland cropping.

Groundwater is also an important source of water for industry and agriculture in the catchment. The groundwater and surface water systems in the catchment have a range of connectivity which varies from being highly connected on a permanent or seasonal basis to being permanently disconnected. The interaction is influenced by surface and groundwater use, climate and flood frequency, significance and duration.

Supporting a complex range of natural ecosystems, the Murrumbidgee catchment contains many significant wetland habitats such as the extensive Lowbidgee wetlands and the Tuckerbill and Fivebough Swamps listed under the international Ramsar Agreement for their ecological importance. Extensive areas of riparian river red gum forest along the middle and lower reaches of the river provide valuable riparian habitat for waterbirds and a variety of threatened fauna species.

More detailed information on the catchment is available in the report *Water resources and management overview: Murrumbidgee catchment* available from the department's website at www.industry.nsw.gov.au/water

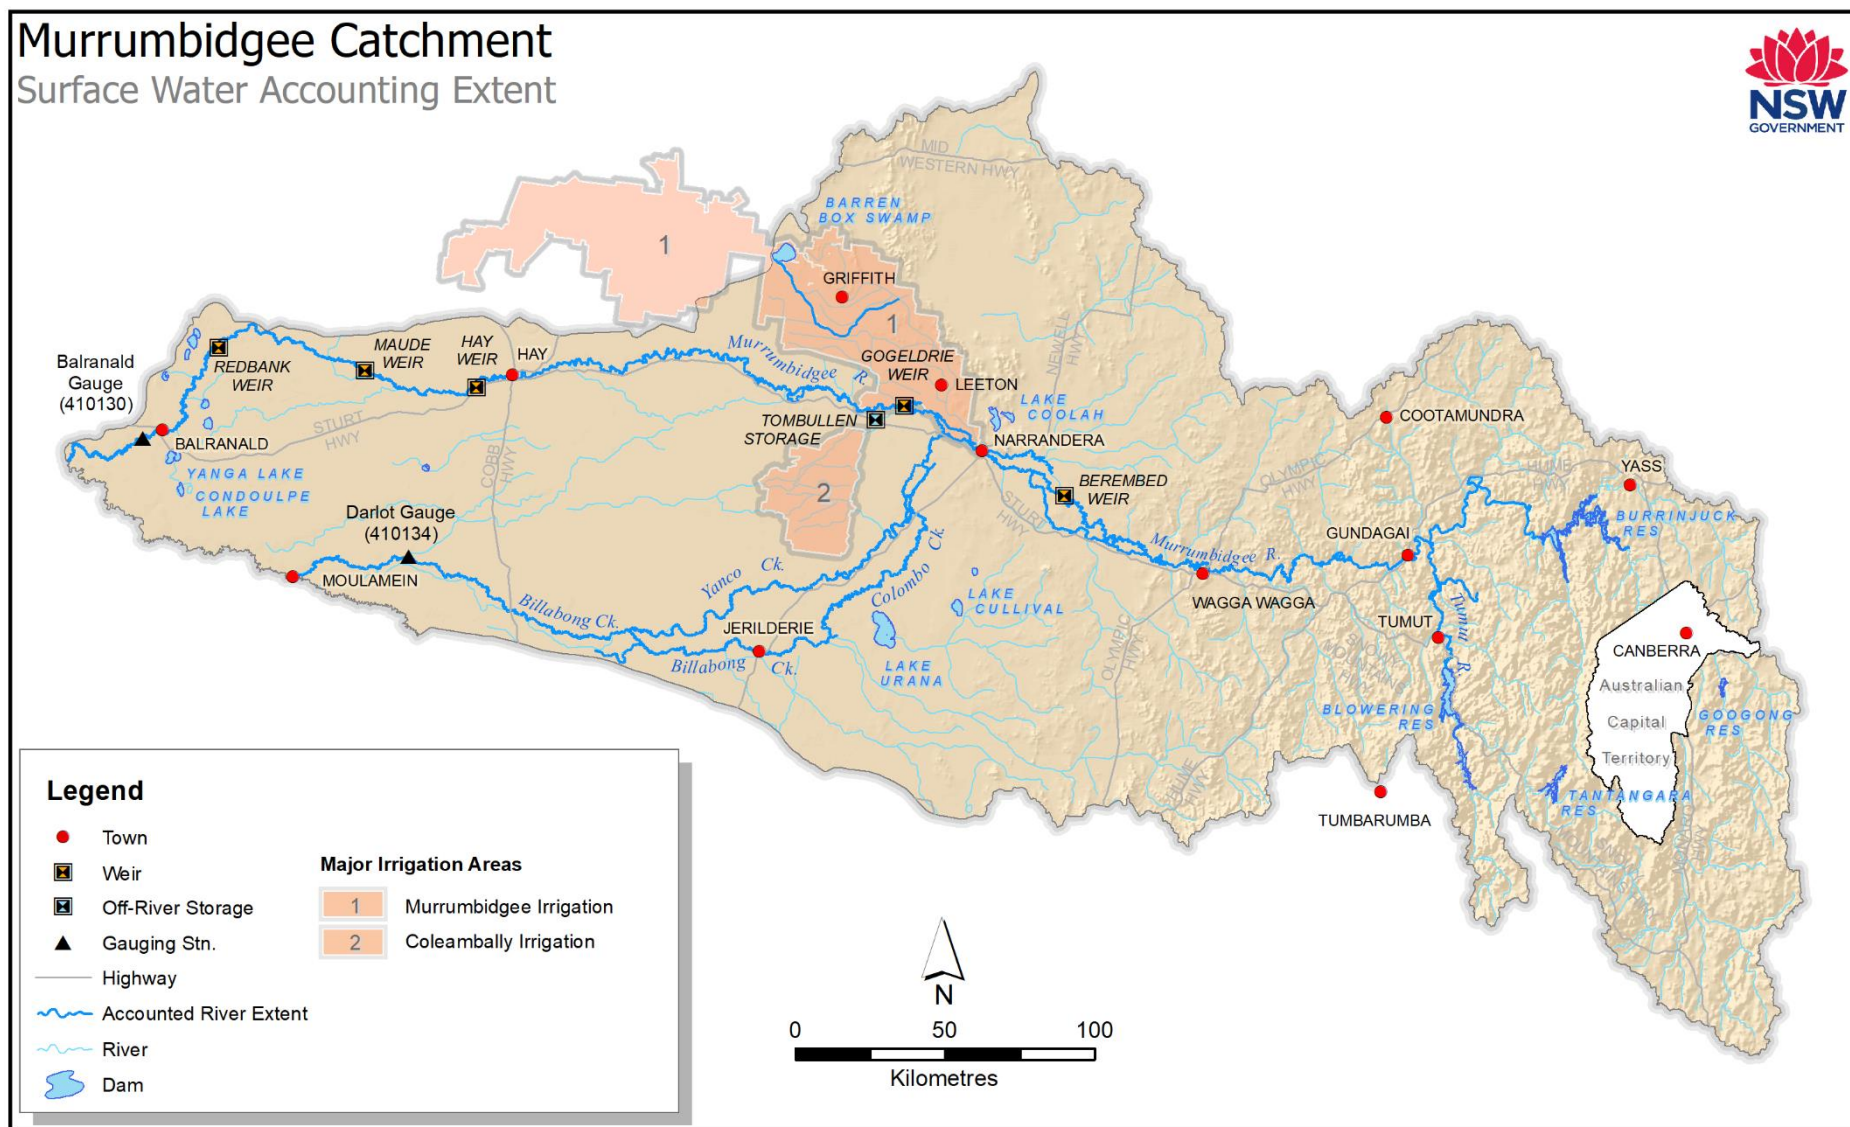

Accounting extent

This report covers the extent illustrated in Figure 1 and details the water management associated with that area. It includes the Tumut River from Blowering Dam to the river's confluence with the Murrumbidgee River, the Murrumbidgee River from Burrinjuck Dam to its confluence with the Murray River (downstream of Balranald), Billabong Creek to its junction with the Edward River downstream of Darlot, Yanco Creek and Colombo Creek.

A full list of the water courses considered to be part of the regulated Murrumbidgee River can be obtained in the *Water Sharing Plan for the Murrumbidgee Regulated River Water Source 2016* (see www.industry.nsw.gov.au/water).

While physical groundwater volumes that interact with the regulated river are included in GPWAR statements where possible (and any interactions not directly estimated form part of the unaccounted difference) all other groundwater flows and groundwater management are excluded from the GPWAR.

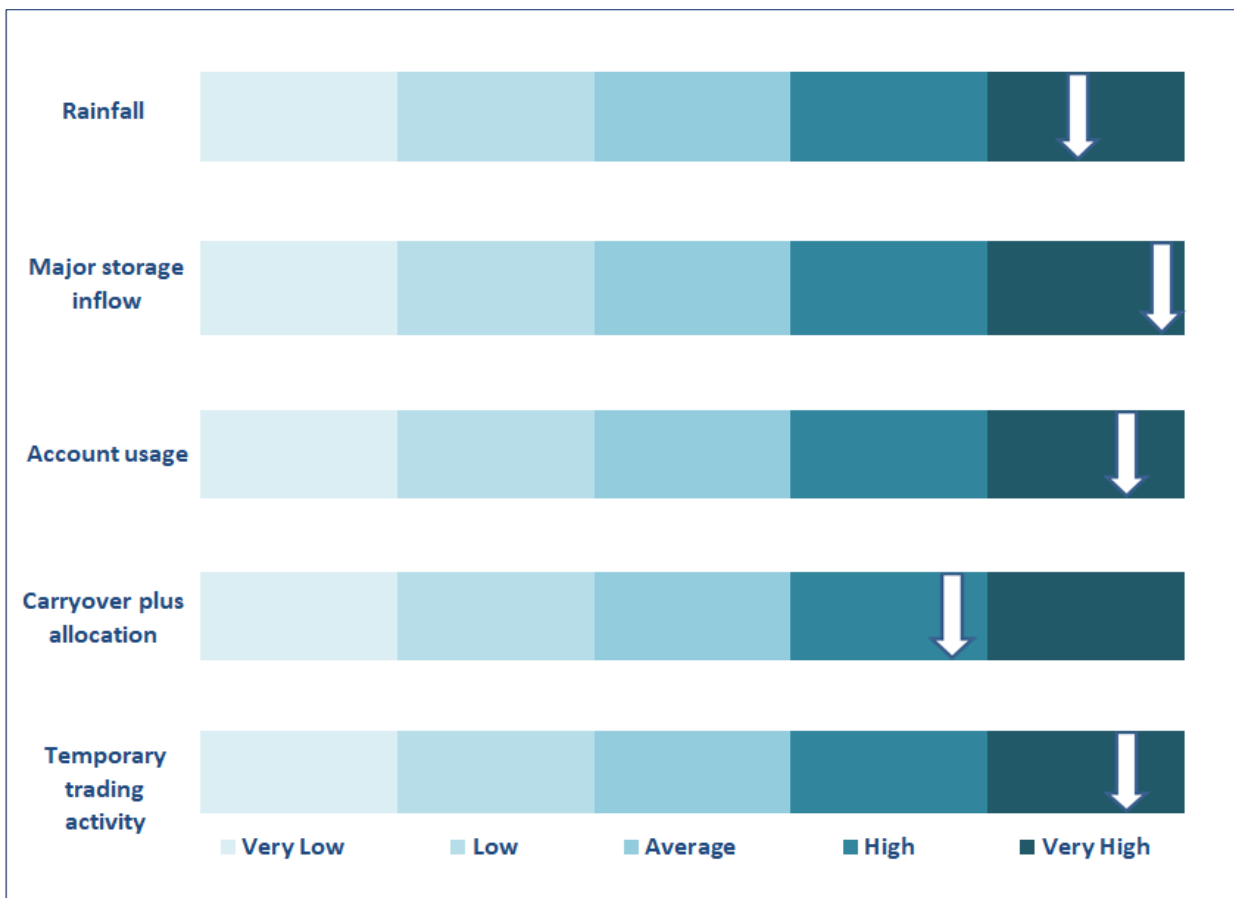

Figure 1: Surface water geographical extent of the accounts

Snapshot

The key indicators for the reporting period relative to other years under water sharing plan management conditions are presented in Figure 2. Rainfall across the catchment was in the very range of average while effective allocation (carryover plus allocation) was comparatively high. Account usage, major storage inflow and temporary trading activity were all in the very high range. The temporary trading activity for 2021–22 was the second highest under water sharing plan management conditions.

Figure 2: 2021–22 Summary indicators for the reporting period

Climate

At Tumbarumba (upper catchment) 1,350 mm of rainfall was recorded in the reporting period (Table 1). Comparatively this volume of rainfall is:

- 139% of the long-term historical median rainfall for this location
- 81% of the highest annual (July-June) volume on record at the location (1,663 mm).

Significant rainfall fell in the months of November 2021 (231 mm) and January 2022 (187 mm) (Figure 3 and Figure 4).

At Hay (lower catchment) 472 mm of rainfall was recorded in the reporting period (Table 2). Comparatively this volume of rainfall is:

- 137% of the long-term historical median rainfall for this location
- 53% of the highest annual (July-June) volume on record at the location (893 mm).

Significant rainfall fell in November 2021 (73 mm) and January 2022 (70 mm) (Figure 3 and Figure 4).

A spatial comparison of rainfall in the reporting period against a longer term rainfall is presented Figure 5 (reporting period) and Figure 6 (average annual rainfall 1961–90). Spatially, rainfall totals during the reporting period were above average across the full extent of the catchment.

¹ Long-term statistics are derived from the Bureau of Meteorology – climate data online. The data presented is collected from stations ‘72043 – Tumbarumba Post Office’ and ‘75031 – Hay (Miller Street)’. Historical statistics uses data from June 1886 to June 2021 for Tumbarumba and June 1881 to June 2021 for Hay.

Figure 5: Annual rainfall for the reporting period

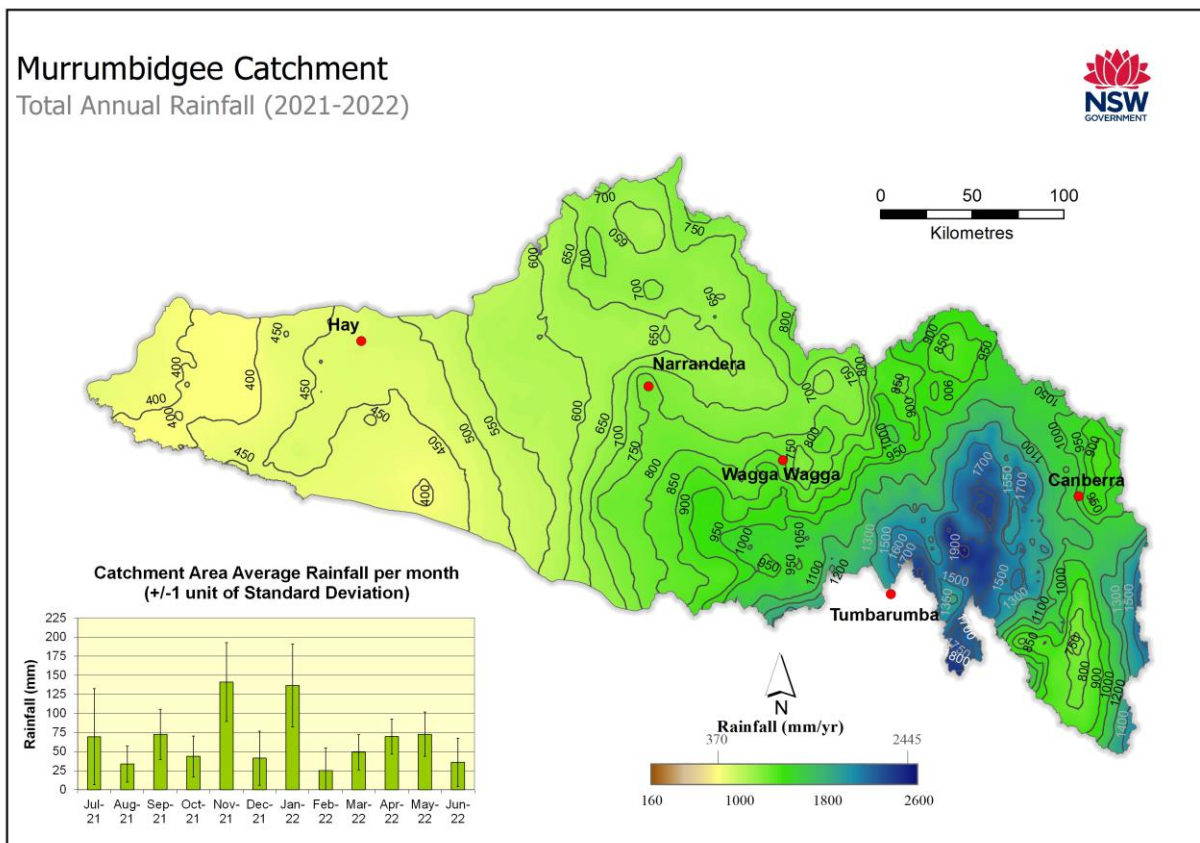

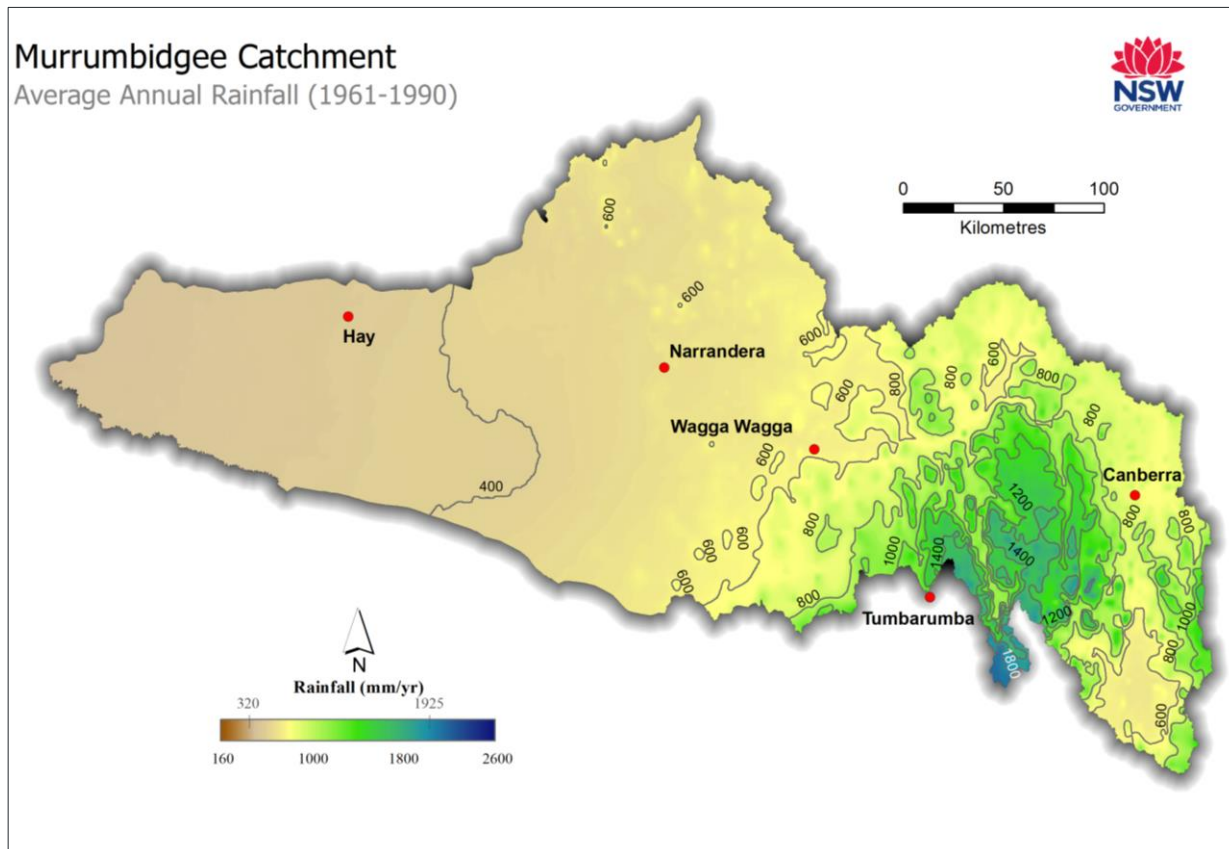

Figure 6: Average annual rainfall (1961-90)

Dam inflows

Historically, the long-term average annual flow (inflow) at the Burrinjuck Dam site has varied significantly cycling through prolonged periods of wet and dry flow regimes. Broadly, the data (Figure 7) illustrates predominantly:

- dry conditions 1900 to 1950
- wet conditions 1950 to 1990
- dry conditions 1990 to present.

For the reporting period, the inflow to Burrinjuck Dam was 3,605,099 megalitres (Figure 8) which is:

- 371% of the long-term median annual inflow (972,285 megalitres per year)
- Comparatively very high to the historical record, exceeding 98% of years on record (1890–91 to 2021–22)
- the 2nd consecutive year of above average inflow for this storage.

The maximum mean daily inflow rate for the reporting period was 67,766 megalitres, occurring on 12 December 2021 (Figure 9).

Daily inflow figures for Blowering Dam (which receives regulated inflows from the Snowy Mountains Scheme) are presented in Figure 10.

Storage volume

Burrinjuck

- Volume at the commencement of the reporting period was 985,570 megalitres or 96% of full supply capacity (Figure 11).
- Volume held at the end of the reporting period was 883,994 megalitres or 86% of full supply capacity.
- The maximum volume held during the reporting period was 1,050,607 megalitres or 102% of full supply capacity on 27 July 2021.

Blowering

- Volume at the commencement of the reporting period was 1,568,331 megalitres or 96% of full supply capacity (Figure 12).
- Volume held at the end of the reporting period was 1,592,228 megalitres or 98% of full supply capacity.
- The maximum volume held during the reporting period was 1,638,925 megalitres or 100% of full supply capacity on 30 July 2021.

Figure 7: Long-term annual flow upstream of Burrinjuck Dam cumulative deviation from the mean

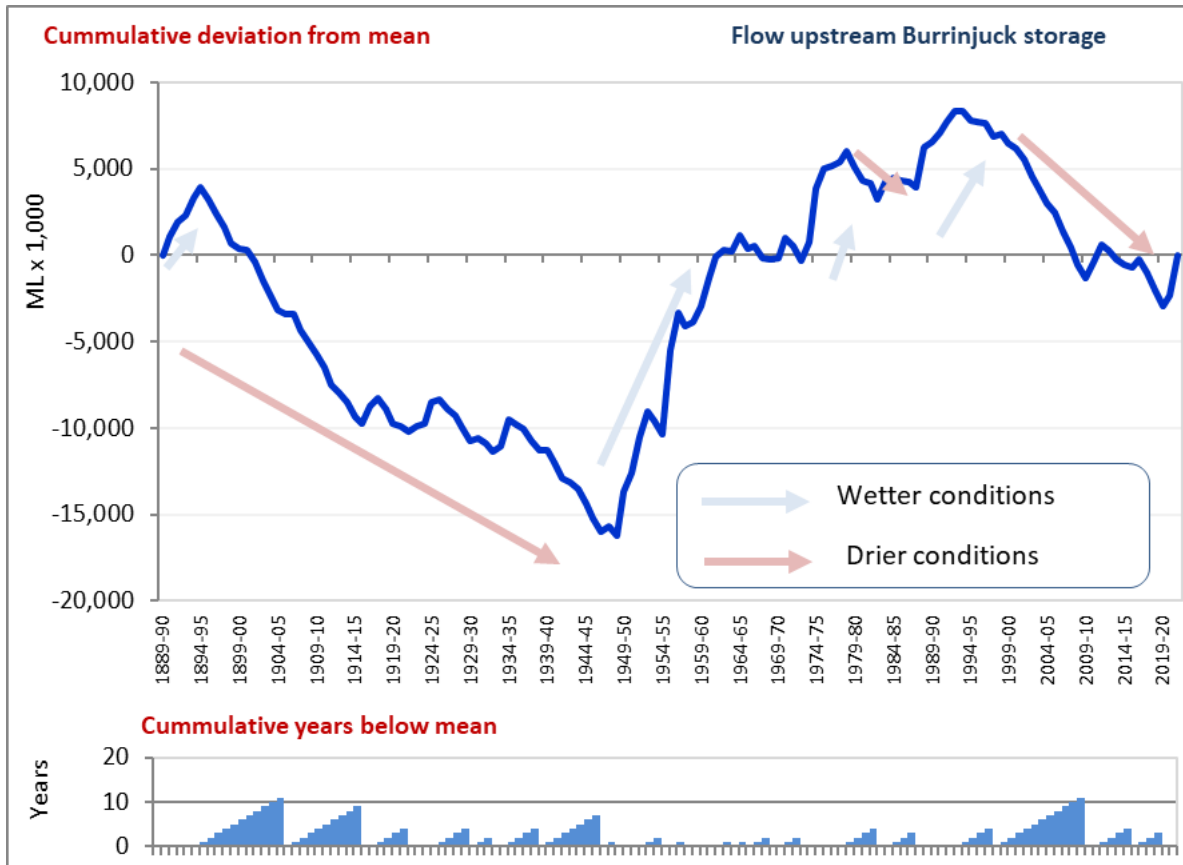

Figure 8: Long-term inflows to Burrinjuck Dam against mean and reporting year inflow

Figure 9: Daily inflows to Burrinjuck Dam and rainfall (reporting period)

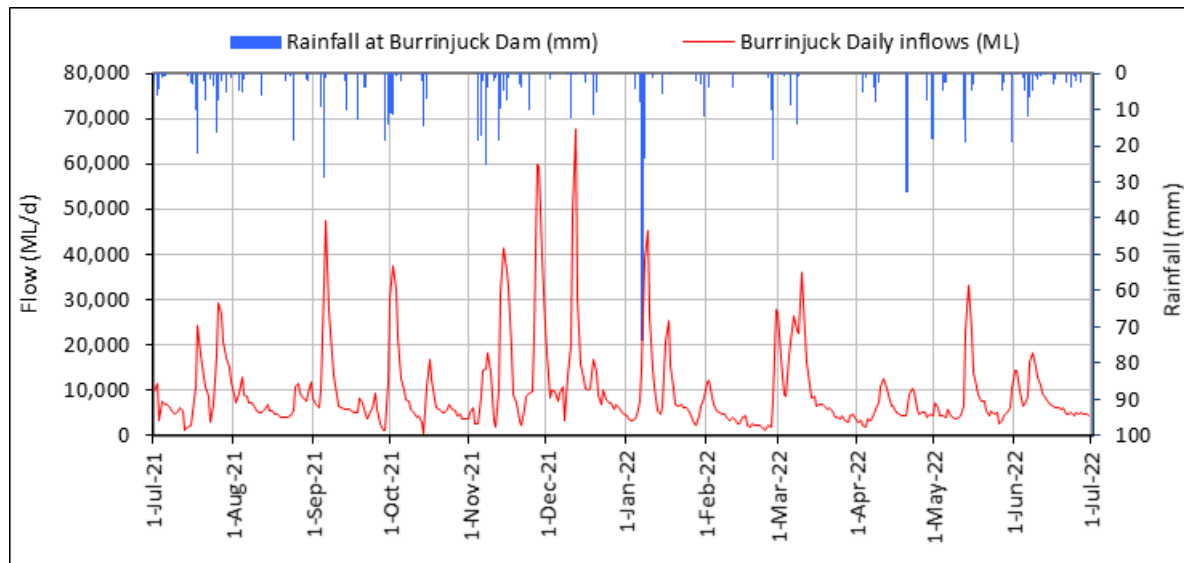

Figure 10: Daily inflows to Blowering Dam and rainfall (reporting period)

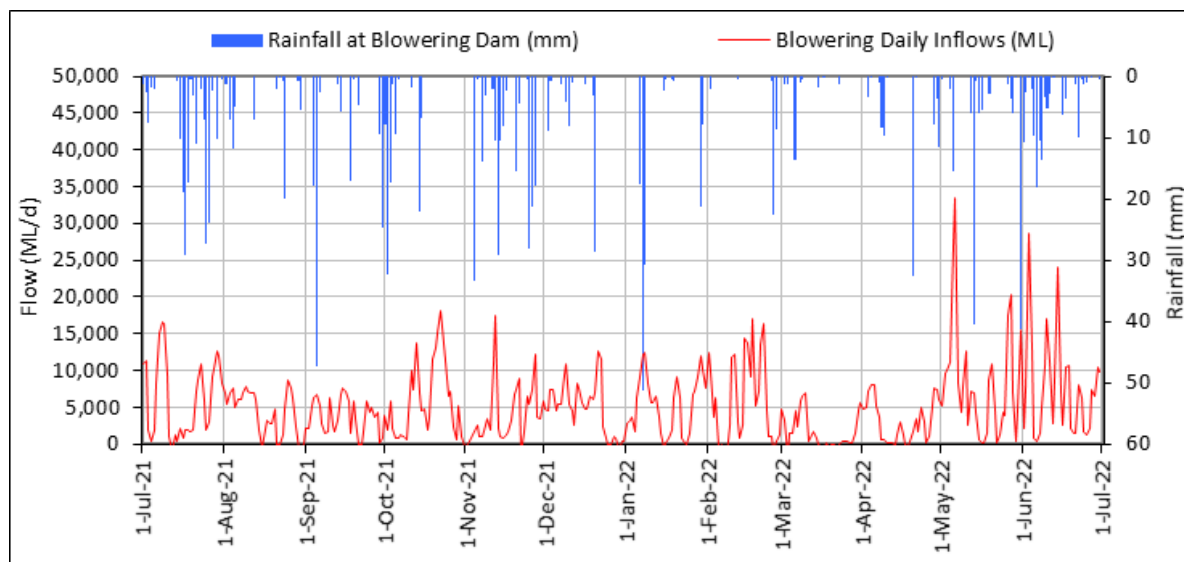

Figure 11: Burrinjuck Dam storage volume and percentage full

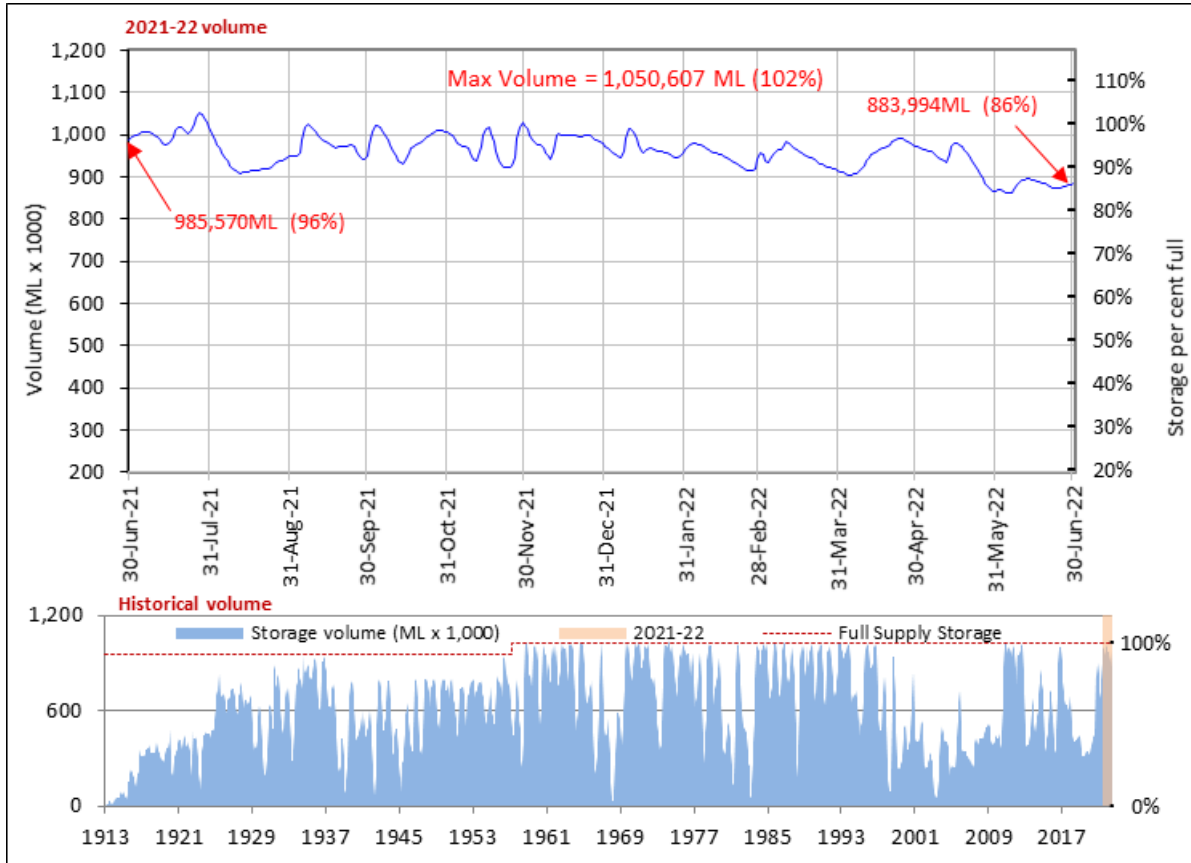

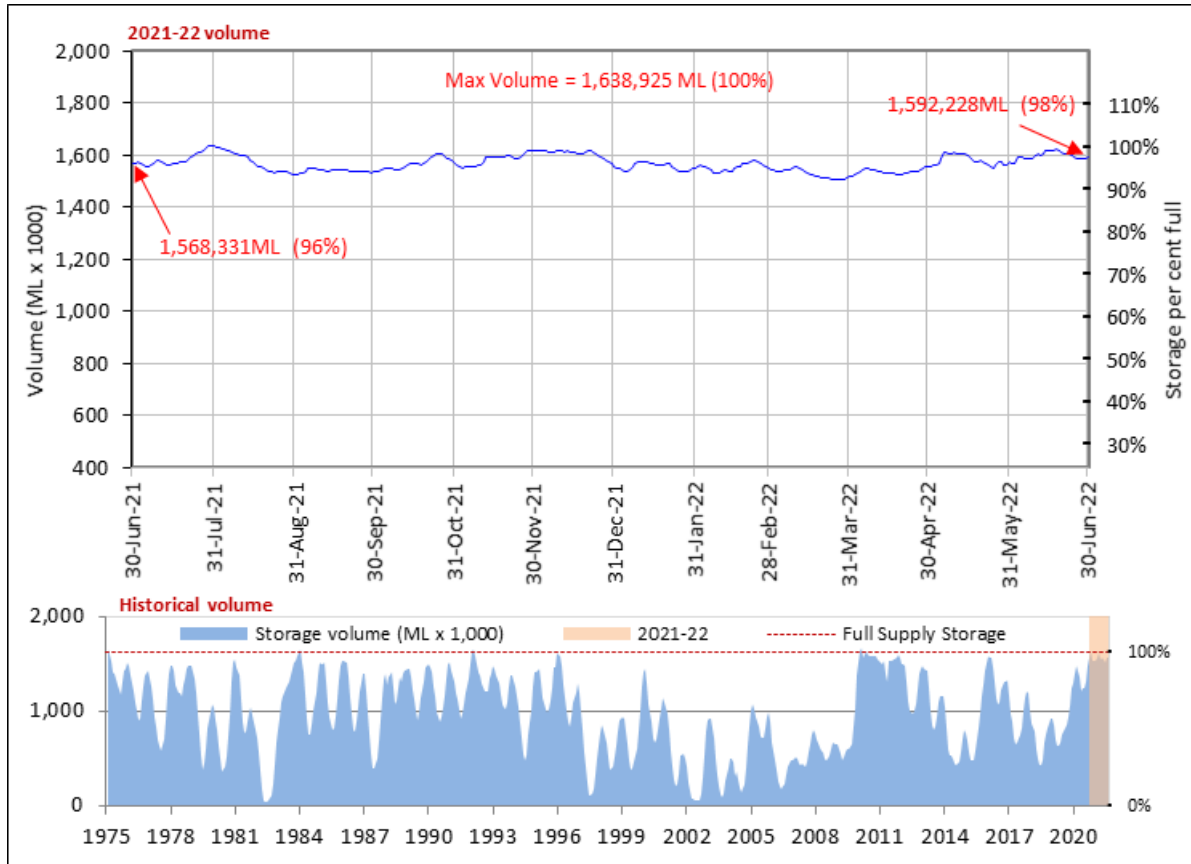

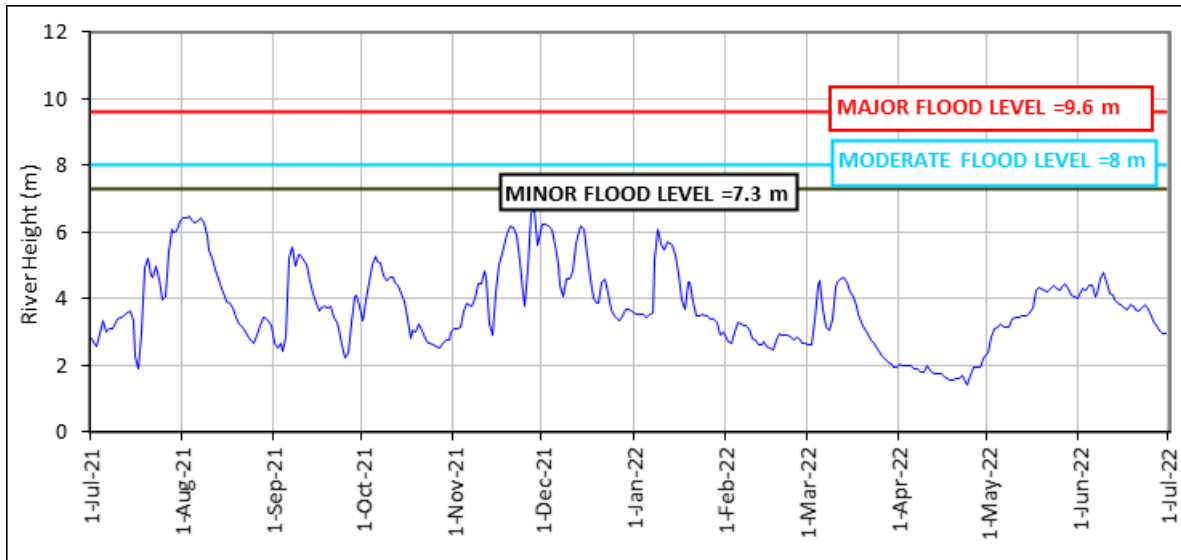

Figure 12: Blowering Dam storage volume and percentage full

Major high flow events

No high flow events occurred in the Murrumbidgee during the reporting period (Figure 13). River height at Wagga Wagga remained below the minor flooding indicator level of 7.3 metres for the entire water year. The maximum recorded river height at this location was 6.7 metres.

Figure 13: Murrumbidgee River at Wagga Wagga maximum daily flow heights²

Surface water resources and management

Policy and management

The Murrumbidgee Regulated River Water Source was managed under the conditions set out in the *Water Sharing Plan for the Murrumbidgee Regulated River Water Source 2016*. This plan commenced on 1 July 2016 and will remain active until 30 June 2026 or alternatively until a replacement plan is gazetted. The water sharing plan was produced to meet the water management principles outlined in the *Water Management Act 2000*.

Access rights

- Access licence share components decreased in the reporting period by 3 shares (Figure 14) resulting from cancellation of 3 domestic and stock licences. Domestic and stock licences are non-tradeable “specific purpose” licences. Entitlement will commonly vary as unwanted licences are surrendered to avoid further water charges, or alternatively, new licences issued following approved applications for new specific purpose water access licences.
- Total issued share on 30 June 2022 was 3,654,214, which includes 198,780 shares of supplementary access licences and 747,000 shares of supplementary (Lowbidgee) access licences (Table 3).

² Flood indicator levels sourced from the Bureau of Meteorology

Figure 14: Murrumbidgee share component since the commencement of the water sharing plan³

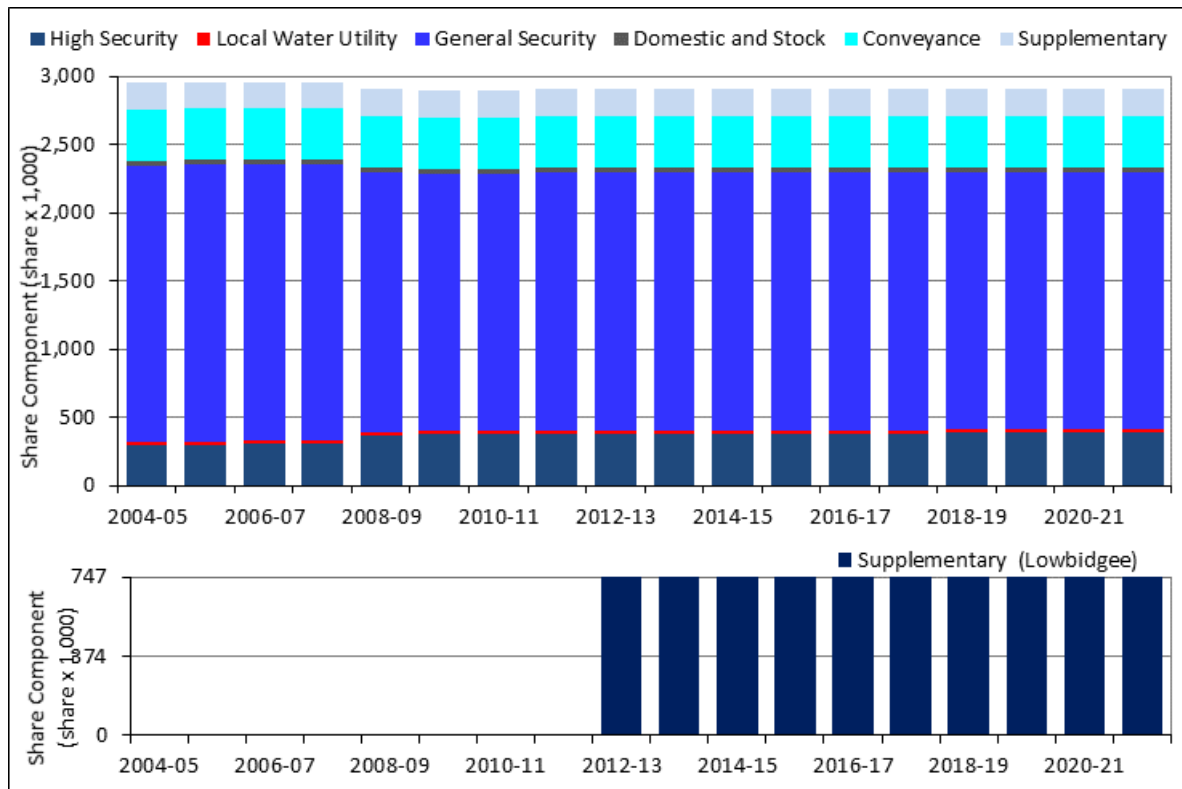

Table 3: Issued share component annual change

Licence category	Share component 30 June 2021	Share component 30 June 2022	Share change
Domestic and Stock	30,161	30,158	3
Local Water Utility	23,816	23,816	0
High Security	386,498	386,498	0
General Security	1,891,995	1,891,995	0
Conveyance	375,968	375,968	0
Supplementary	198,780	198,780	0
Supplementary (Lowbidgee)	747,000	747,000	0
Total	3,654,218	3,654,215	3

Access licence account management

An annual accounting (with carryover) procedure is implemented in this water source allowing for general security (and conveyance) access licence holders to mitigate the risk of future shortfalls

³ Includes all access licences issued under the water sharing plan and therefore held environmental water.

and carryover up to 0.30 megalitres per share (30%). A limit of 1 megalitre per share (100%) for carryover plus water received from available water determinations applies.

Additionally, general security account holders have access to a provision under the water sharing plan (uncontrolled flow access) to further mitigate potential shortfalls in dry years with low allocations. During periods of announced access, general security holders are eligible to extract water from unregulated events downstream of the major storages, without debit to the access licence balance. Should allocations improve part or all of any unregulated take may revert to become accountable against the licence. The triggers and limits for access to this water are summarised in Table 5. Further information on uncontrolled flow access is available in note 23 of this GPWAR.

All other categories of licence have a maximum credit of 100% or 1 megalitre per share, and do not have any carryover provisions available. The access licence accounting rules are summarised in Table 4.

Table 4: Murrumbidgee licenced allocation accounting rules

Licence Category	AWD plus carryover limit	Carryover limit	Annual use limit	Maximum AWD
Coleambally Irrigation (Conveyance)	1 ML/share	0.30 ML/Share	N/A	1 ML/share
Domestic and Stock [All categories]	N/A	0 ML/Share	N/A	100%
Local Water Utility	N/A	0 ML/Share	N/A	100%
Murrumbidgee Irrigation (Conveyance)	1 ML/share	0.30 ML/Share	N/A	1 ML/share
Regulated River (Conveyance)	1 ML/share	0.30 ML/Share	N/A	1 ML/share
Regulated River (General Security)	1 ML/share	0.30 ML/Share	N/A	1 ML/share
Regulated River (High Security) [All categories]	N/A	0 ML/Share	N/A	1 ML/share
Supplementary Water	N/A	0 ML/Share	N/A	1 ML/share
Supplementary Water (Lowbidgee)	N/A	0 ML/Share	N/A	1 ML/share

Uncontrolled Flow Access (UCF) licence category	AWD limit for UCF	AWD plus carryover limit for UCF	AWD plus UCF usage limit	AWD plus carryover plus UCF limit
Regulated River (General Security)	0.70 ML/share	0.85 ML/Share	0.85 ML/share	1 ML/share

Extreme events stage and temporary water restrictions

The NSW Extreme Events Policy was released in October 2018 to provide a framework for managing extreme events in the major river systems of the NSW Murray–Darling Basin. This framework is based on a staged approach, providing a range of measures for water managers to implement as conditions deteriorate.

Temporary water restrictions are an example of the type of measures that can be implemented to manage a water shortage. These restrictions are issued under section 324 of the *NSW Water Management Act 2000* and have been implemented in several river valleys in the recent drought to preserve water for critical needs.

Table 6 outlines the conditions that may be associated with different stages of criticality for surface water quality. Further information is available at industry.nsw.gov.au/water/what-we-do/legislation-policies/eep

Table 6: Determination of stages of criticality for surface water quantity

Stage	Stage description	Stage evidence base
1	Normal management	Can deliver all account water under normal river operations practices.
2	Emerging drought	Unable to deliver 100% of high priority account water and maximum expected use of general security under normal river operations practices.
3	Severe drought	Only able to deliver restricted high priority demands and restricted remaining general security account water.
4	Critical drought	Only able to deliver restricted town water supply, stock and domestic and other restricted high priority demands.

Extreme events stage

The Murrumbidgee regulated river remained in stage 1 (normal operation) for the entirety of the 2021-22 reporting period (Figure 15).

Figure 15: Drought stage for the reporting period referenced with monthly headwater storage inflows, monthly storage inflow variance from mean

Temporary water restrictions

No restrictions on access licences occurred in the reporting period.

Water resources and availability

Regulated supply

- Domestic and Stock, Local Water Utility and subcategories of High Security licences received an opening available water determination (AWD) of 100%, the maximum allowable under the water sharing plan.
- High security access licences (no subcategory) received an opening AWD of 0.95 megalitres per share (95% equivalent). An additional 0.05 was allocated on 1 November 2021 (as general security reached full allocations). This cumulative allocation of 1 megalitre per share (100% equivalent) is the maximum allowable under the water sharing plan.
- Regulated river (Conveyance), Murrumbidgee Irrigation (Conveyance) and Coleambally Irrigation (Conveyance) had a combined carry over of 19,486 megalitres. These licences received equivalent opening AWD's of 100%, 95% and 94%, respectively.
- General security access licences had a carryover of 415,016⁴ megalitres into the reporting period, equating to 22% of share.
- General security access licences received an opening AWD of 0.3 megalitres per share (30%).
- General security access licences received four additional AWD announcements taking the total water availability (carryover plus allocation) to 100% by 1 November 2021 (Figure 19).
- Across all categories, by volume, this was the second consecutive water year that all categories of access licence reached maximum allocation and the 6th occurrence under water sharing plan management conditions (
- Figure 20).
- Full allocation announcement details are available in note 2 of this GPWAR.

Allocation account summary

A summary illustration of the accounting for High Security, Conveyance and General Security access licence categories in the Murrumbidgee is provided in Figure 16, Figure 17 and Figure 18 respectively. Detailed information on the water accounts for all categories of licence issued are provided in Note 1 of this report.

⁴ Carryover figure presented prior to adjustments for snowy transfer (water for rivers program) licences. These accounting adjustments are presented in the account balances report presented in Note 1, Table 11 of the GPWAR.

Figure 16: Annual water account summary Murrumbidgee High Security

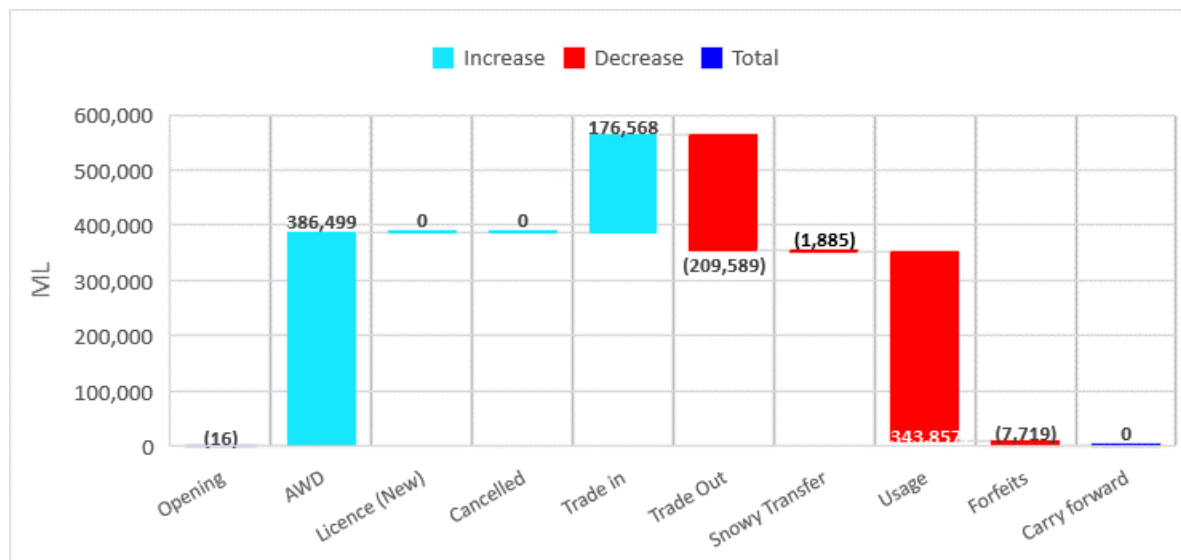

Figure 17: Annual water account summary Murrumbidgee Conveyance

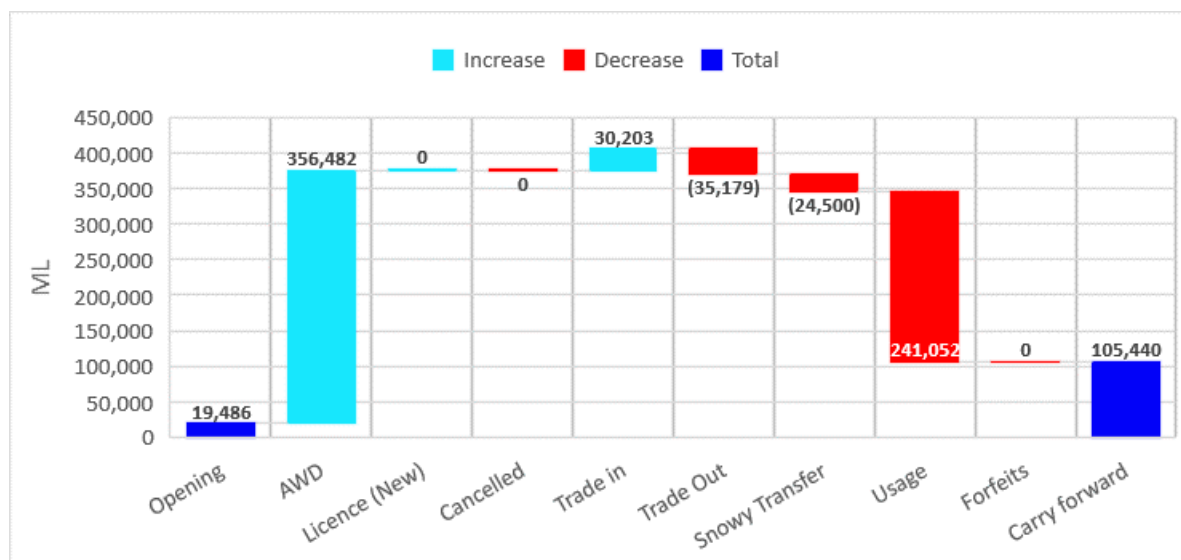

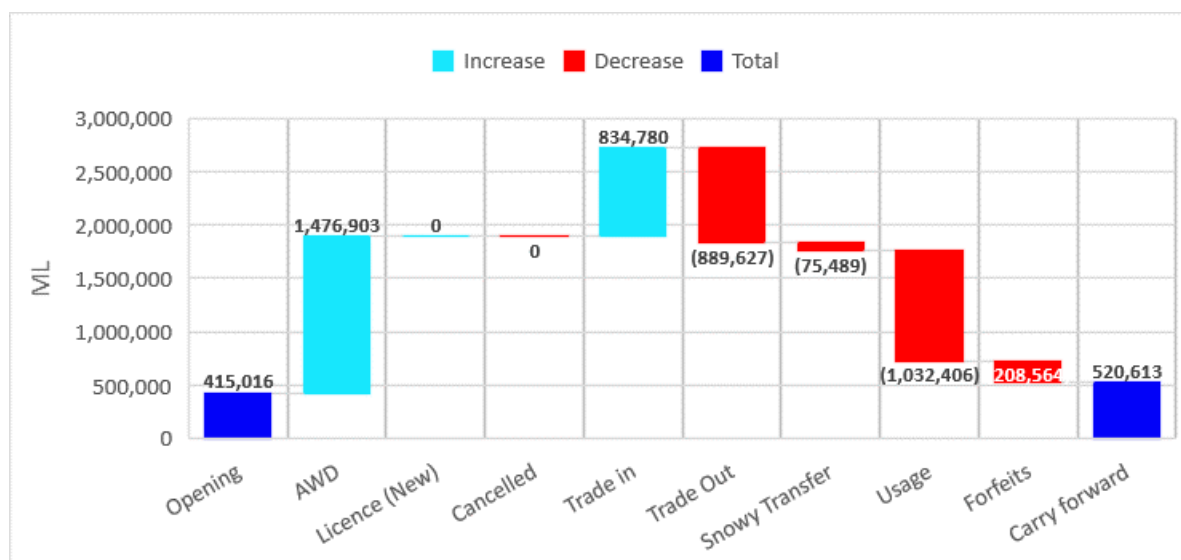

Figure 18: Annual water account summary Murrumbidgee General Security

Supplementary access and tributary inflow

- Supplementary access licences including the sub-category of supplementary water (Lowbidgee) received an opening AWD of 1 megalitre per share (100% equivalent), the maximum allowable under the water sharing plan. Access to the allocation is dependent on operational announcements for supplementary access throughout the year.
- At water source level 365 days of supplementary access was available in the reporting period. Similar historical access had not been available since the breaking of the millennium drought.
- By volume 50% of total tributary inflow to the regulated Murrumbidgee River, downstream of the major storages was contributed by the Goobarragandra River and Tarcutta Creek (Figure 22)
- Detailed supplementary announcement details and section usages are available in note 23 of this GPWAR.

Figure 19: Incremental available water determinations and carryover volumes for general security as a proportion of share component

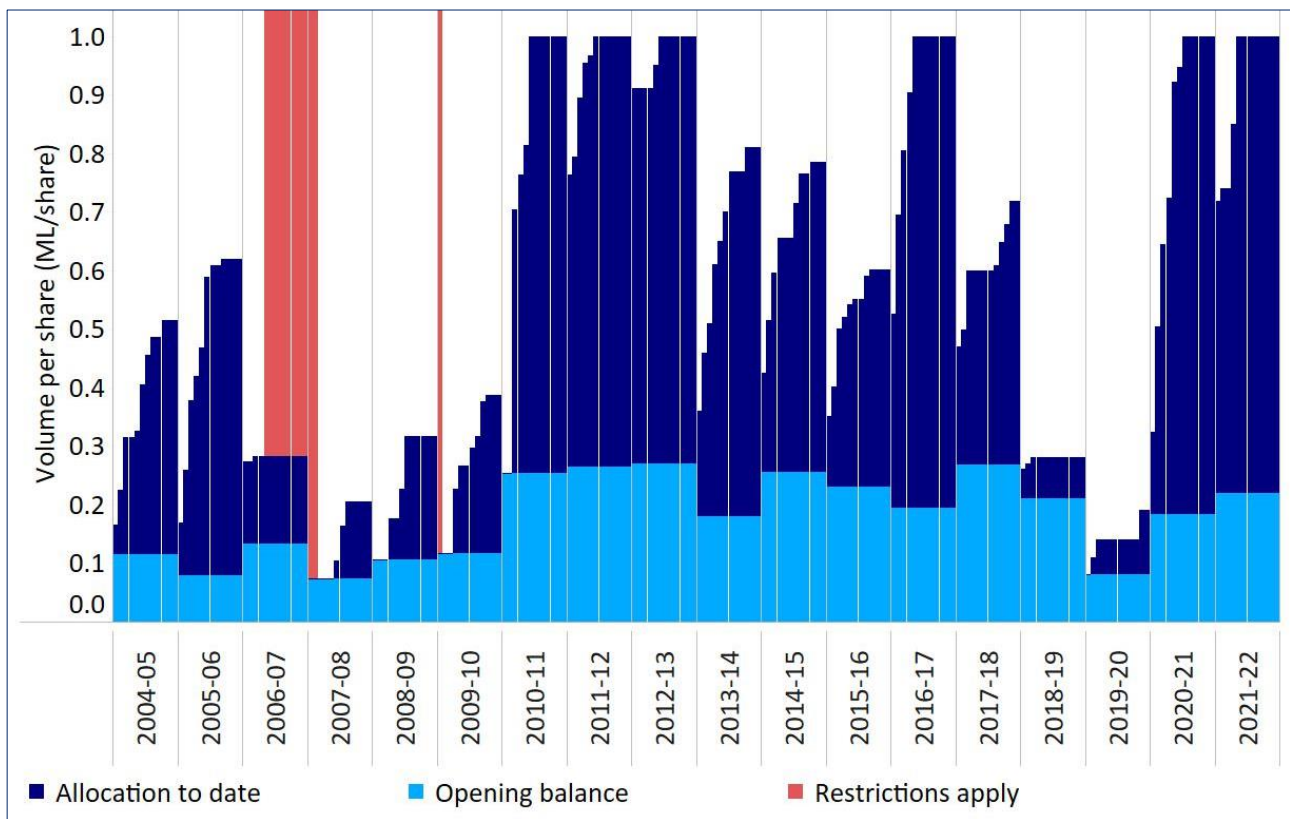

Figure 20: Murrumbidgee water availability (carryover plus available water determinations)⁵

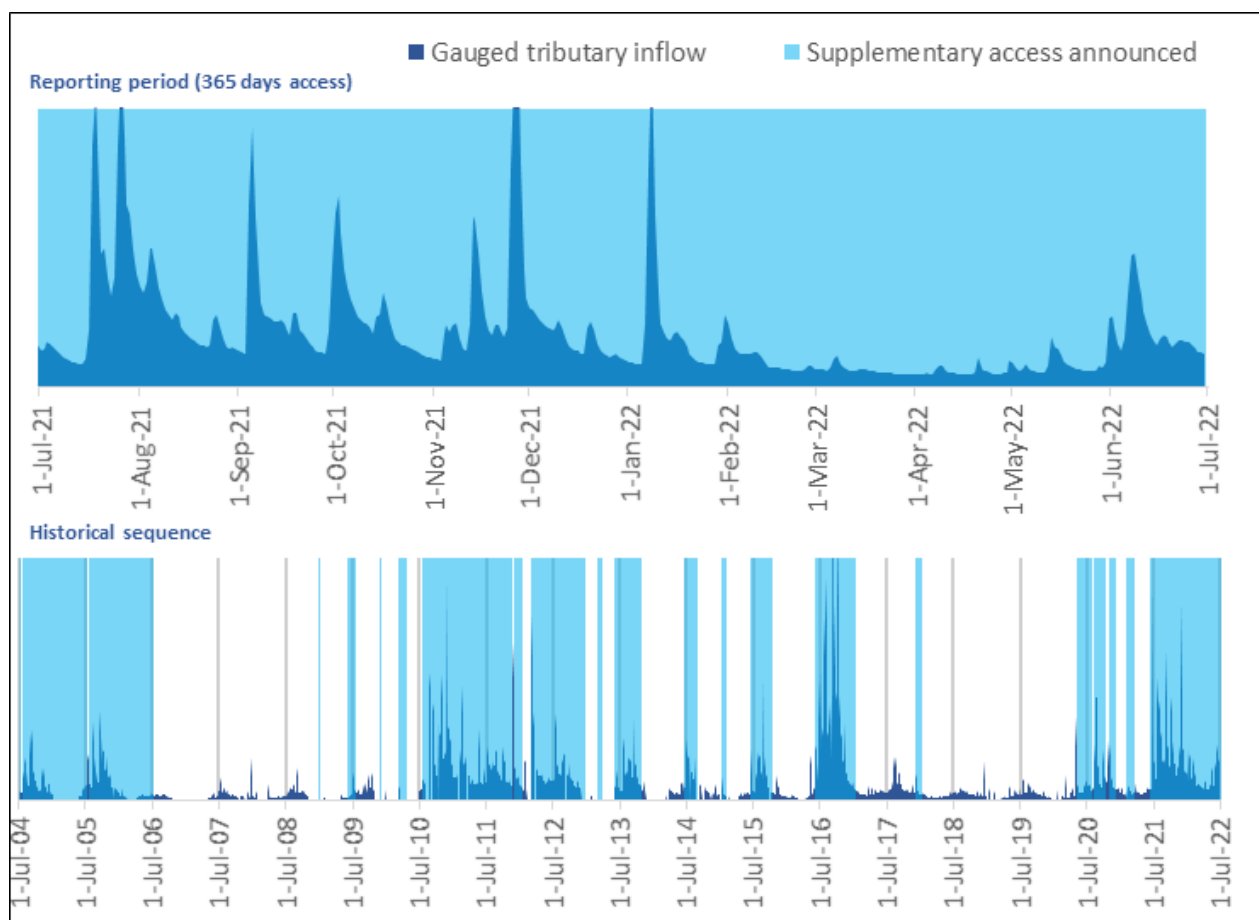

Figure 21: Supplementary event access

⁵ Water availability refers to the sum of water that was made available in accounts and does not take into account annual use limits. It is calculated as the total carryover for a licence category plus the total available water determinations for the year.

Figure 22: Measured tributary inflow contributions

Account usage

Account usage from regulated supply (excluding supplementary and uncontrolled flow access) was 1,648,666 megalitres for the reporting period (Figure 23).

In addition to this supply:

- 175,428 megalitres was used by Supplementary access licence holders (Figure 24)
- 367,370 megalitres was used by Supplementary (Lowbidgee) access licence holders (Figure 24)

Usage (all forms of take) totalled 2,191,465 megalitres, which was the 2nd highest under water sharing plan management conditions and the highest since 2012–13 (Figure 25). The average usage (all forms of take) increased to 1,464,412 (2004–05 to 2021–22).

Of the total usage 71% was used against consumptive access licences and 29% against held environmental access licences (refer to ‘Held Environmental Water’ for further details).

Figure 23: Licenced usage from regulated supply (excluding supplementary and uncontrolled flow access) by licence category

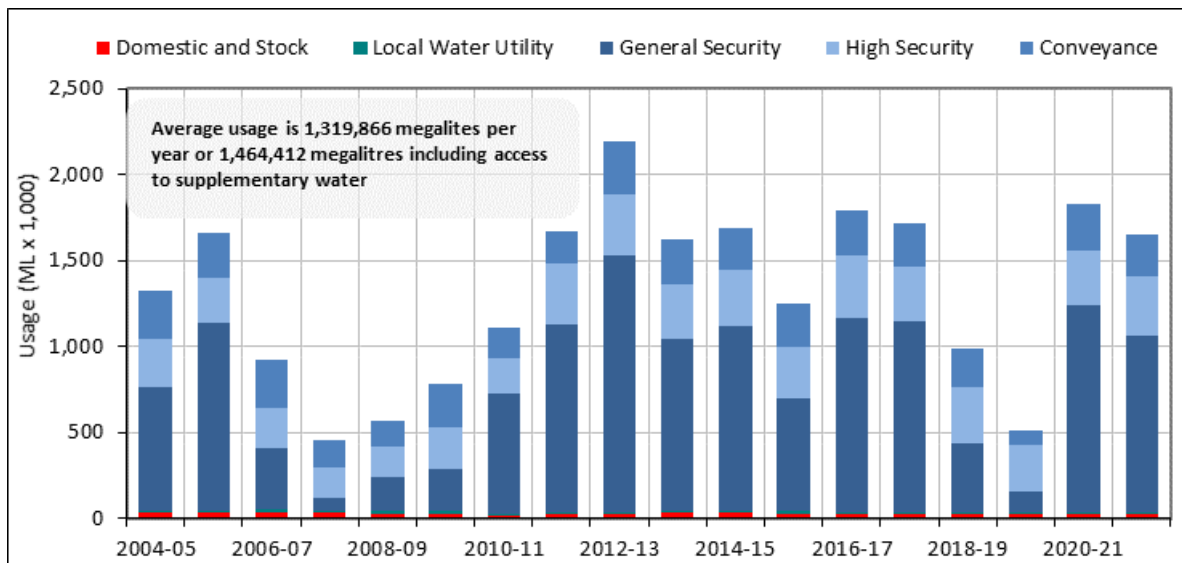

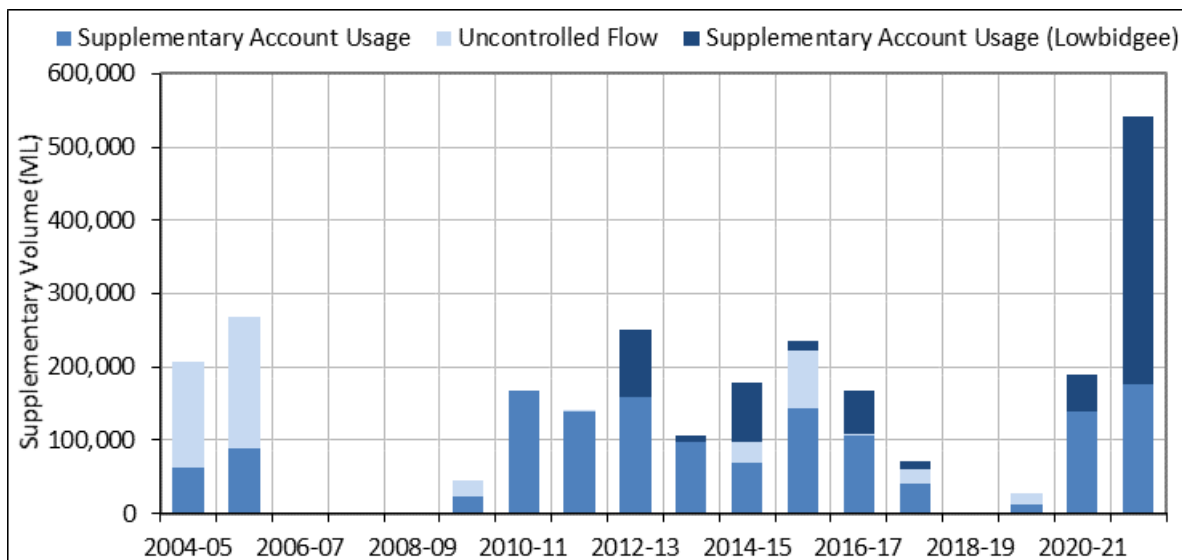

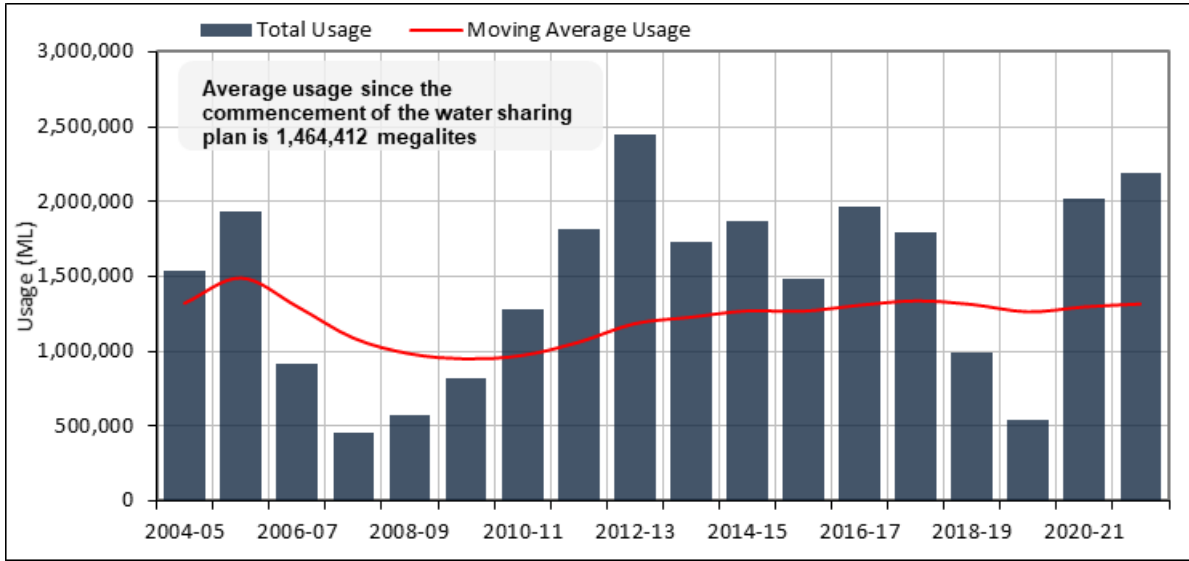

Figure 24: Murrumbidgee supplementary and uncontrolled flow usage⁶

⁶ Supplementary Water (Lowbidgee) licences were introduced in 2012-13 water year.

Figure 25: Total account and moving average usage under water sharing plan management

Utilisation and inactive share

An access licence is considered to be inactive if the holding does not use water or access the temporary trade market for the reporting period. Utilisation reflects the amount of water used relative to the maximum amount available for use.

- 5% of general security access licence share component was inactive for the reporting period an increase of 1% on the prior year (Table 7).
- 1% of high security access licence share component was inactive for the reporting period, which is equal to the prior year inactivity.
- 8% of supplementary water (including Lowbidgee access) was inactive, a decrease of 1% reflecting continued availability to excess flows, downstream of the major storages. Access to this water is from unregulated supply (opportunistic access) and activity is largely climate driven.
- Utilisation of available water from regulated supply was 68%, a decrease of 15% on the prior reporting period (Figure 26). General security carryover to 2021-22 was 28% approaching the maximum carryover limit of 30%.

Figure 26: Murrumbidgee utilisation of regulated water available ⁷

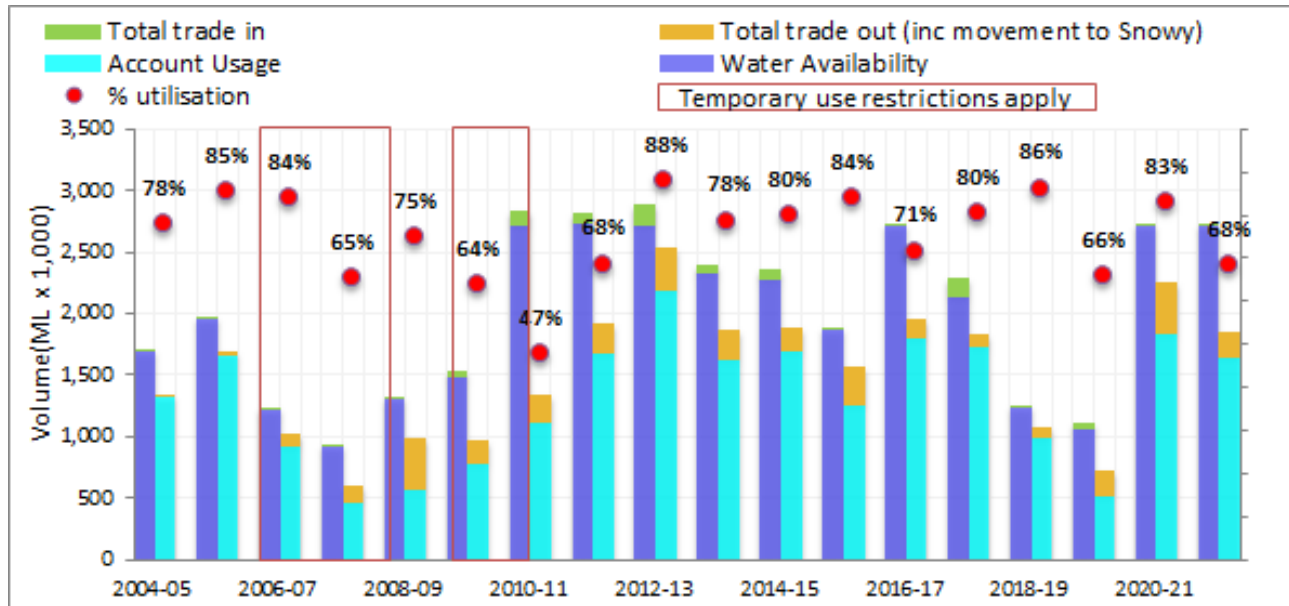

Table 7: Murrumbidgee inactive licence summary

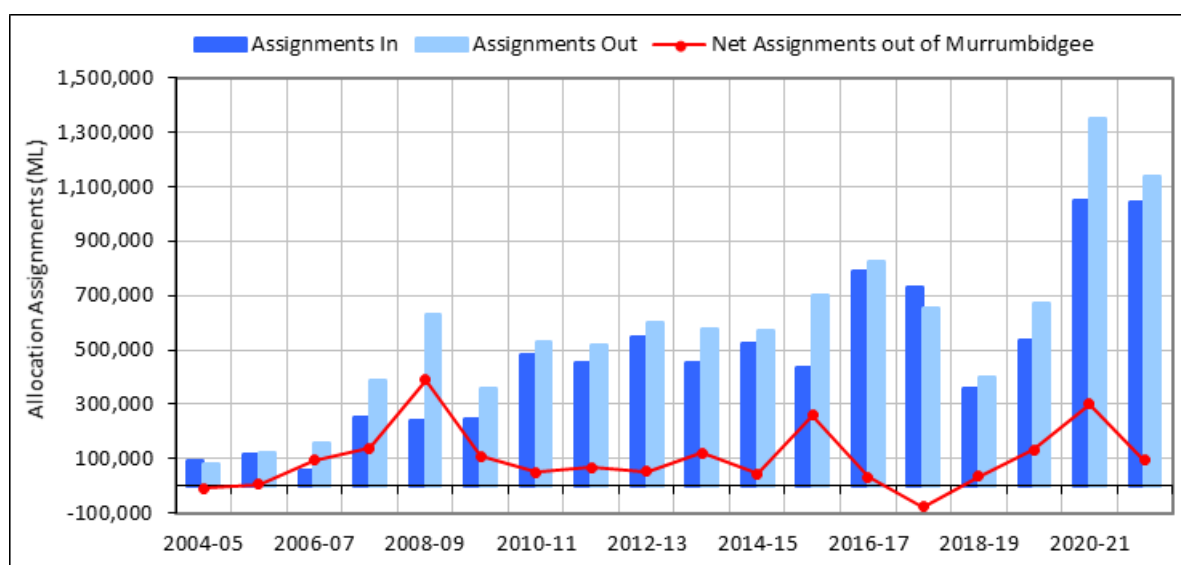

Licence category	Inactive licences (number) 2021-22	Inactive share component 2021-22	Inactive share % of total 2021-22	Inactive share % of total prior year (2020-21)
Coleambally Irrigation (Conveyance)	1	3,500	3%	3%
Domestic and Stock	179	3,308	17%	14%
Domestic and Stock [Domestic]	40	112	41%	42%
Domestic and Stock [Stock]	120	1,056	10%	7%
Local Water Utility	2	10	0%	29%
Murrumbidgee Irrigation (Conveyance)	1	20,000	8%	8%
Regulated River (Conveyance)	2	1,000	34%	34%
General Security	435	103,703	5%	4%
High Security	114	5,408	1%	1%
High Security [Aboriginal Cultural]	0	0	0%	0%
High Security [Research]	0	0	0%	0%
High Security [Town Water Supply]	0	0	0%	0%
Total	894	138,097	5%	4%
Unregulated (flow dependant) supply Supplementary Water	87	4,276	2%	6%
Unregulated (flow dependant) supply Supplementary Water (Lowbidgee)	19	75,763	10%	10%
Unregulated (flow dependant) supply Total	106	80,039	8%	9%

⁷ Water usage excludes water taken under a supplementary access licence or under uncontrolled flows access. Total water availability excludes supplementary access licences.

Temporary trading

- The total volume of allocation assignments into Murrumbidgee access licences was 1,041,550 megalitres⁸ (Figure 27).
- The total volume of allocation assignments out of Murrumbidgee access licences was 1,135,596 megalitres resulting in a net assignment out of the Murrumbidgee of 94,045 megalitres.
- The majority of water moved out of the Murrumbidgee was to the NSW Murray regulated river water source (Figure 28).
- The Murrumbidgee intervalley trade account closed at 127,570 megalitres (owed to external) on 30 June 2022, up from 92,337 in the prior period (Figure 29). Refer to disclosure note 5 (Table 18) of this GPWAR for further detail.

Figure 27: Allocation assignments and net trade out of the Murrumbidgee⁹

⁸ Excluding trade between supplementary licences

⁹ Excludes supplementary trading but including intravalley, intervalley and interstate trades.

Figure 28: Net assignment out of the Murrumbidgee by water source location

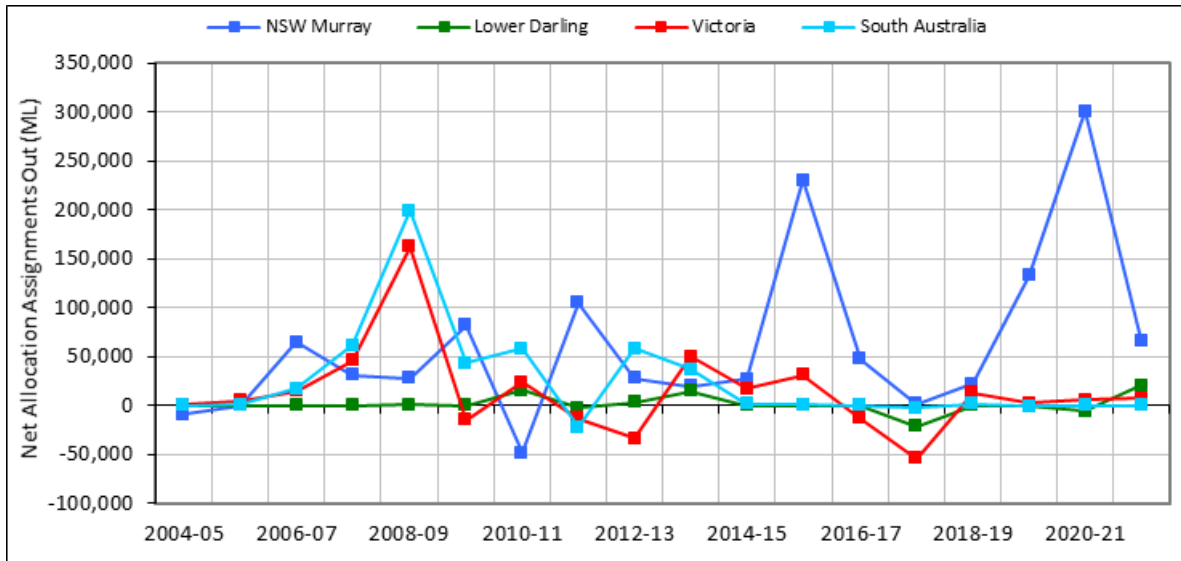

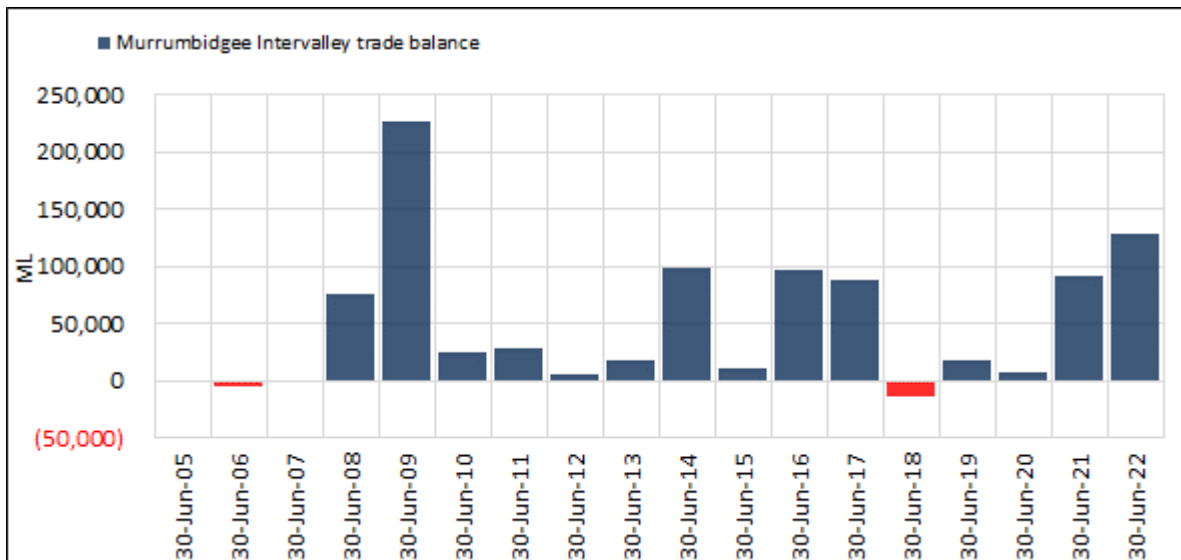

Figure 29: Murrumbidgee intervalley trade account balance on 30 June

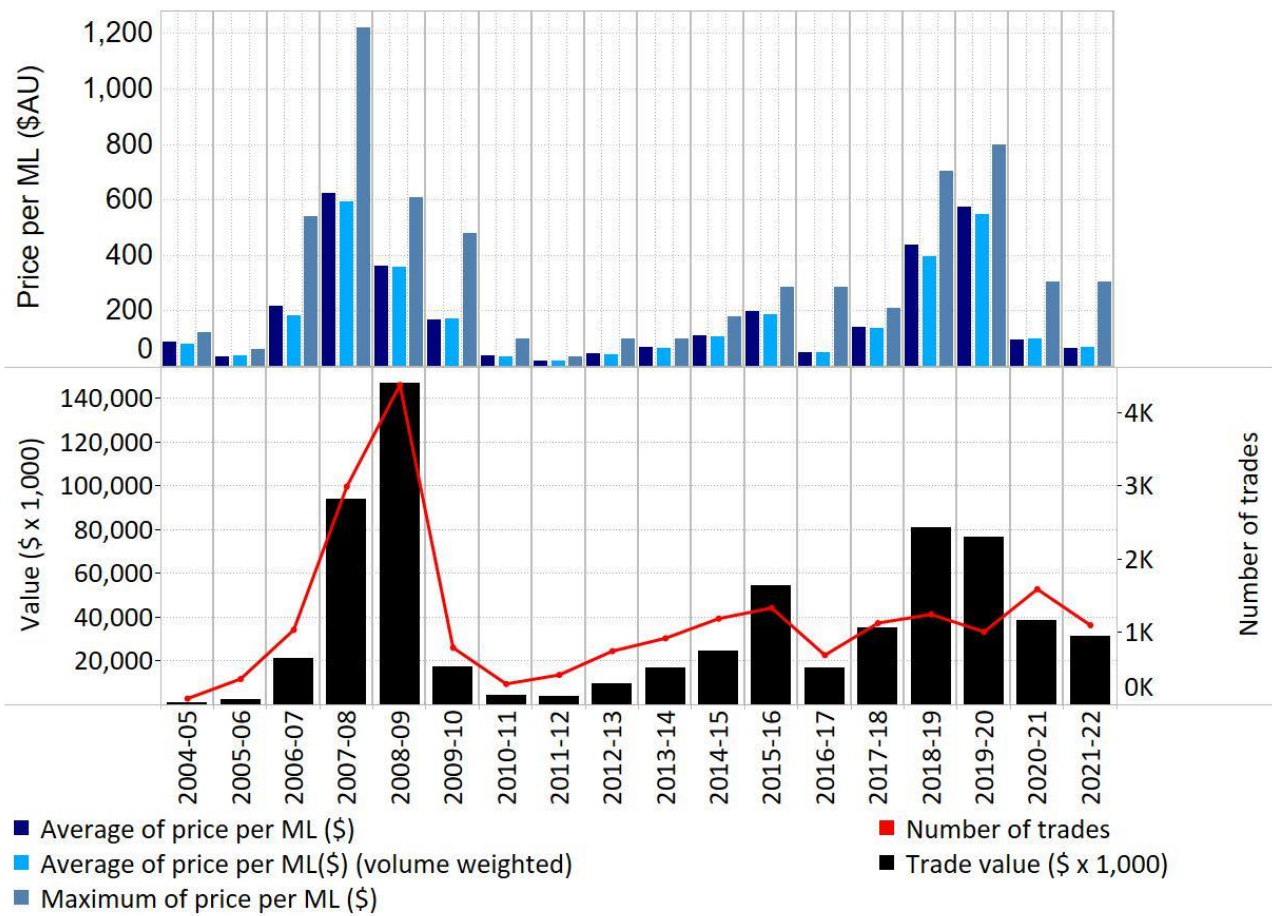

Temporary commercial statistics

For the reporting period, considering commercial trades only (considerations greater than \$1 per megalitre), 1,091 transactions were processed (Figure 30) with the following characteristics:

- The average price for water was \$66 per megalitre (volume weighted average \$68) an 30% decrease on the prior reporting period and the lowest since 2016-17.
- The maximum price for water was \$303 per megalitre.
- The total trade value was \$31,188,000, a 19% decrease on the prior reporting period and a 5-year low.

Figure 30: Allocation assignment commercial statistics¹⁰

Permanent commercial statistics

For the reporting period, considering commercial trades only (> than \$1 per megalitres), 32 general security share assignment transactions (Figure 31) were processed with the following characteristics:

- The average price for general security was \$2,420 per share (weighted average \$2,416), a 15% increase on the prior year average.
- The maximum price was \$2,650 per share (this was the highest price for general security on record)
- The total trade value was \$43,339,000 which was a 123% increase relative to the prior reporting period.
- The general security sale price within the Murrumbidgee relative to other NSW regulated river water sources selling share in the reporting period is provided in Figure 32.

¹⁰ Only includes transactions where the total consideration of the dealing exceeds \$1. A maximum limit is applied equal to the mean plus 3 times the standard deviation

A total of 22 high security commercial transactions were processed (Figure 33) with the following characteristics:

- The average price was \$8,208 per share (weighted average \$8,316), a 12% relative increase to the prior reporting period
- The maximum price was \$9,000 per share (this was the highest price for high security on record)
- The total trade value was \$19,452,000 which was a 241% increase relative to the prior reporting period.
- The high security sale price within the Murrumbidgee relative to other NSW regulated river water sources selling share in the reporting period is provided in Figure 34.

Considering all categories of licence 8,863 shares were assigned for commercial purposes (and zero shares associated with environmental purchases) (Figure 35).

In addition to share assignments, a total of 14,899 shares (all categories of licence considered) were subject to a change of holder for commercial purposes through 14 transactions (Figure 36). Note that reliable pricing information for change of holder dealings is unavailable as often the sale is bundled with a purchase of land and/or a number of different licence categories.

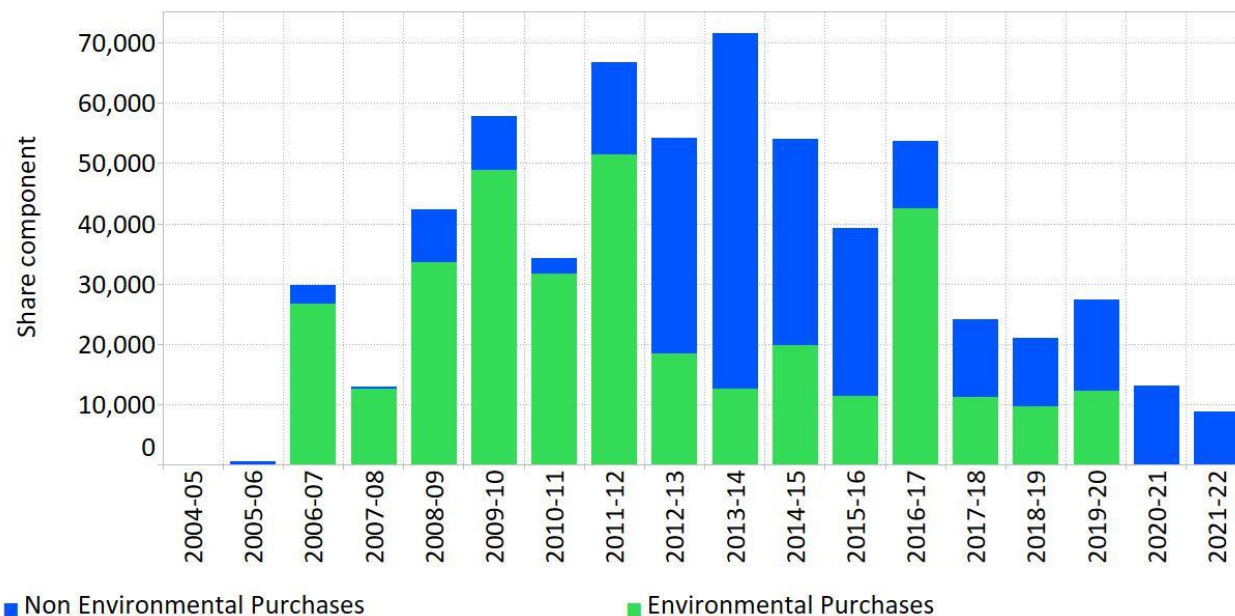

Figure 35: Total share assignments and held environmental purchases¹¹

¹¹ Only includes transactions where the total consideration of the dealing exceeds \$1. All licence categories have been included.

Figure 36: Change of holder commercial statistics¹¹

Held environmental water

- There was no change to the held environmental water portfolio in the reporting period (Figure 37).
- A total of 1,152,608 shares (across all categories of access licence) were managed for environmental purposes as of 30 June 2022¹².
- A total of 642,219 megalitres (usage) was debited against held environmental licences, the highest usage under water sharing plan management conditions (Figure 38).
- In addition to the account usage 101,874 megalitres accumulated in Murrumbidgee held environmental access licences (acquired under the water for rivers recovery program) was re-assigned for environmental releases in the Snowy, Snowy Montane and Murray River (Figure 39)¹³.
- Further details on held environmental account water is available in Note 6 of this document, while detailed information on where the water was used and the benefits achieved is available on the department’s Environment, Energy and Science website (www.environment.nsw.gov.au) and the Australian Government’s Department of Agriculture, Water and Environment website (www.environment.gov.au).

¹² Excludes environmental savings acquired that have not been converted to an access licence.

¹³ For further details see note 26 and www.industry.nsw.gov.au/water/basins-catchments/snowy-river/initiative/water-recovery-savings-summary

Figure 37: Held environmental water share component in the Murrumbidgee¹⁴

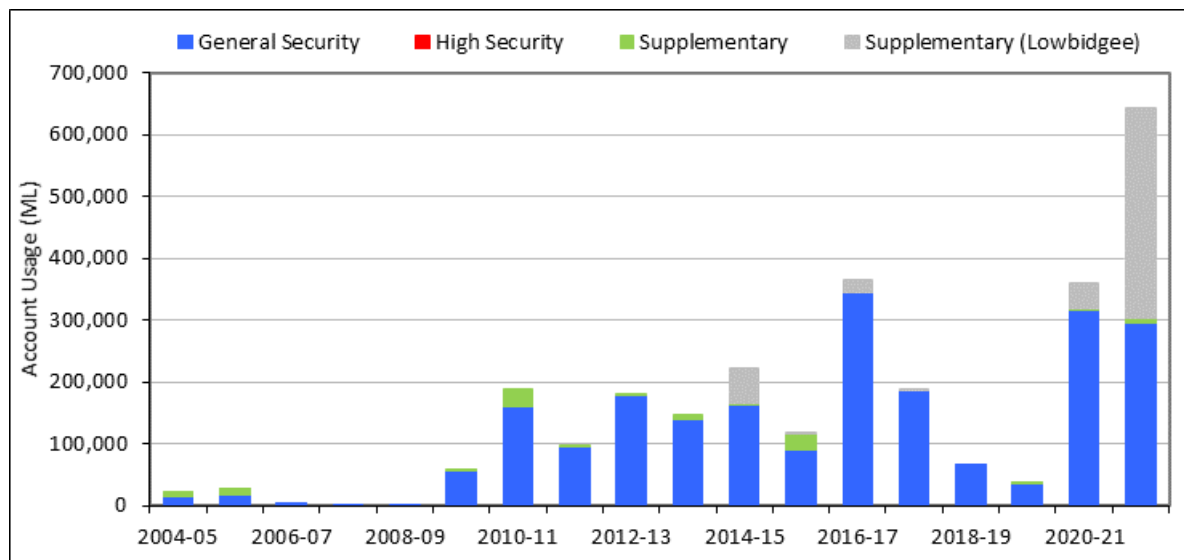

Figure 38: Held environmental water account usage in the Murrumbidgee

¹⁴ Figures represent share at the conclusion of the water year. The licence category Supplementary (Lowbidgee) was created in 2012-13. Figures represent share at the conclusion of the water year.

Figure 39: Murrumbidgee allocation transferred out of the Murrumbidgee (water for rivers program)

Planned environmental water

A wide range of environmental provisions including fixed volumetric targets (e.g. end of system targets), rules based (e.g. translucent storage releases), and account based (discretionally utilised for environmental assets, e.g. environmental water allowance accounts) are implemented through the water sharing plan. A full description of these provisions is provided in Note 7.

- Of the account based planned environmental water a total of 102,516 megalitres of planned environmental water was delivered during the reporting period. This volume was made up of deliveries from the translucent/transparent under release account, the Environmental Water Allowance 1 account (EWA1), Water Allowance 2 account (EWA2) and the Environmental Water Allowance 3 (EWA3) account (Figure 40).
- Additionally, the total water released from Burrinjuck Dam under the translucent/transparent rules of the water sharing plan was 1,521,029 megalitres. Transparent releases from Blowering Dam were considered always met during the reporting period. A total volume of 206,572 megalitres passed Blowering storage under this requirement.
- The required transparent and translucent environmental releases from Burrinjuck storage for the reporting period are presented in Figure 42, along with the actual storage releases.
- The required transparent environmental releases from Blowering storage for the reporting period are presented in Figure 43, along with the actual storage releases.
- Performance against minimum flow requirements for Balranald and Darlot are illustrated in Figure 44 and Figure 45 respectively. Refer to Note 19 for further details.

Figure 40: Total planned environmental water deliveries from Burrinjuck Dam¹⁵

Figure 41: Transparent/translucent releases from Burrinjuck Dam

¹⁵ Under release delivered refers to releases made above the minimum required environmental translucent or transparent releases. The water is effectively used to offset any occurrences where the actual release was less than the required release.

Figure 42: Required environmental releases at Burrinjuck Dam versus actual releases

Figure 45: Billabong Creek at Darlot minimum flow target and deliveries

Water accounting statements

Significant water accounting policies

The water accounting statements in this GPWAR have been prepared using an accrual basis of accounting. All figures are in megalitres (ML).

We have excluded the 'Statement of Physical Flows' from this GPWAR as all transactions have been presented in the statements 'Water Assets and Liabilities' and 'Changes in Water Assets and Water Liabilities'. We have included a physical flow diagram that represents the physical movements of water to more clearly depict those accounting processes associated with physical flow movement.

For general information on how to interpret the water accounting statements, refer to the *Guide to General Purpose Water Accounting Reports* available from the department's website at www.industry.nsw.gov.au/water

Quantification of data

Data accuracy

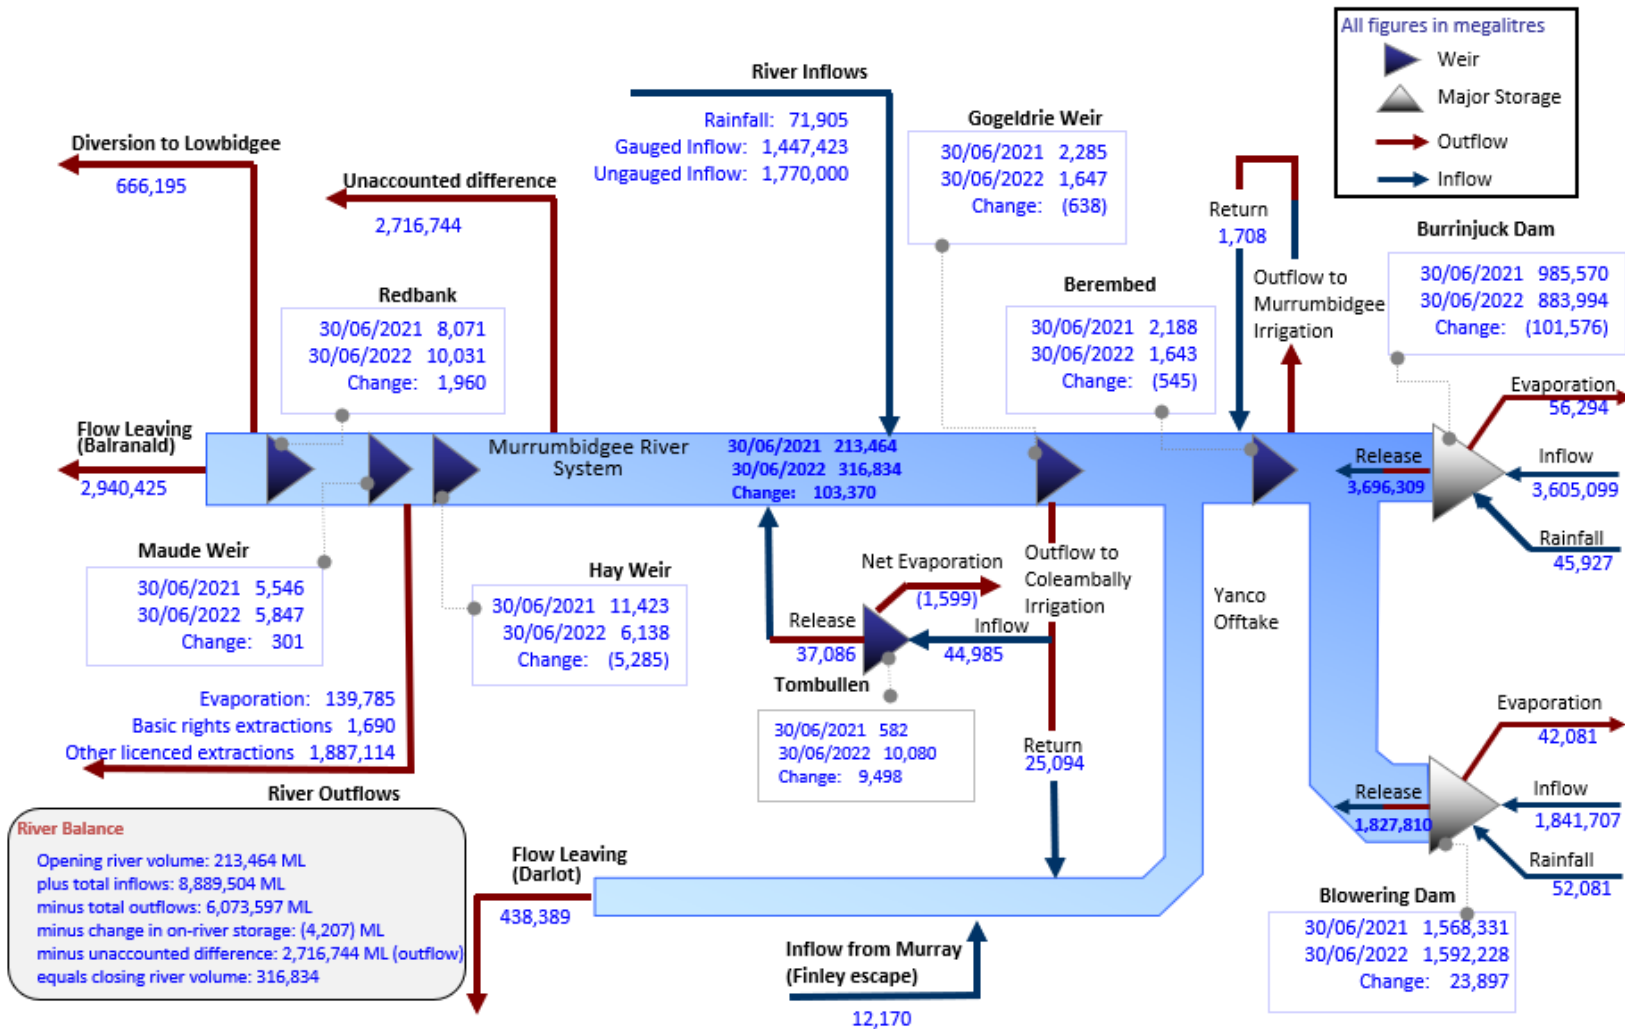

The data used to account for water movement and management in the reporting entity has been obtained from a variety of sources and systems. The data ranges from observed values where a high accuracy would be anticipated through to modelled results and estimates where accuracy can be highly variable depending on a range of factors. To improve accuracy and prevent misuse of the data in the accounts, we have added an accuracy assessment to all figures in the water accounting statements (see Table 8).

Table 8: Water account data accuracy estimates key

Accuracy	Description
A1 ¹⁶	+/- 0% Data is determined rather than estimated or measured. Therefore, the number contains no inaccuracies.
A	+/- 10%
B	+/- 25%
C	+/- 50%
D	+/- 100%

¹⁶ Non-physical administration items, such as available water determinations, trading and carryover volumes are assumed to have no inherent error for the purposes of this report. Items are reported as extracted from the Department of Planning, Industry and Environment's Water group corporate database

2021-22 Murrumbidgee physical flow mass balance diagram

Note: Outflow to Coleambally and Murrumbidgee Irrigation is accounted in the total river extraction transaction. River inflows and outflows are totalled for the regulated accounting extent. River extractions considers gross diversions (recredits), in-stream e-water use and ordered water leaving the system that accounted in other outflow items (detailed in note 21).

Statement of water assets and water liabilities

For the year ended 30 June 2021. In all tables (..) denotes a negative value.

Note disclosures

Reconciliation and future prospect descriptions

This section contains reconciliation and future prospect descriptions for the Murrumbidgee regulated river water source.

Reconciliation of change in net water assets to net change in physical water storage ¹⁷	30 June 2022	30 June 2021
Change in net surface water assets	(252,331)	1,181,495
Apply non-physical asset and liability adjustments ¹⁸	-	-
<i>plus</i> net increase in Allocation Accounts	191,582	76,424
<i>plus</i> net increase intervalley trade account	35,233	86,094
<i>minus</i> net increase in claims to water: Daily release balance	23,900	12,987
<i>plus</i> net increase in claims to water: EWA1	43,753	5,765
<i>plus</i> net increase in claims to water: EWA2	4,395	(34,455)
<i>plus</i> net increase in claims to water: Translucent/Transparent	(15,550)	6,561
total non-physical adjustments	283,313	153,376
<i>equals</i> net change in physical surface water storage	30,982	1,334,871

Reconciliation of closing water storage to total surface water assets ¹⁹	30 June 2022	30 June 2021
Closing water storage	-	-
surface water storage	2,828,442	2,797,455
<i>plus</i> other claims to water (DRB)	2,320	26,220
<i>less</i> other claims to water (IVT)	127,570	92,337
volume in river	316,834	213,493
Total surface water assets to meet future commitments	2,386,358	2,517,845

¹⁷ All figures can be derived from or found directly in the Water Accounting Statements of the General Purpose Water Accounting Report. All figures are in megalitres.

¹⁸ Non-physical changes to the water asset added back into the 'Change in Net Water Assets' to reflect the physical volumetric change in the water storage from the previous year. All figures are reported in megalitres and can be derived from or found directly in the Water Accounting Statements of this report

¹⁹ Reconciliation provides an assessment of the water callable to meet current commitments as of June 30 and provide for new allocations July 1. The assessment does not consider expected inflows in the coming water year. Water owed due to intervalley trading is deducted, as with volume in river to provide a more conservative estimate of useable resources.

Water assets available to settle water liabilities and future commitments within 12 months of reporting date

Final datasets for reporting in the GPWAR, including meter readings by field staff, were not available in time to produce an informative 12-month forecast for report users.

In lieu of this, the links below give the latest water availability information for the Murrumbidgee River Water Source. This includes carryovers and available water determinations at the time of reporting, along with probability information about the Murrumbidgee system's reliability.

Latest water availability

You can find the latest information on water availability, including water allocation statements, water allocations summaries and 2022–23 available water determinations, on the NSW Department of Planning and Environment webpage at industry.nsw.gov.au/water/allocations-availability/allocations

You can also subscribe to receive the latest updates.

Latest storage volumes

Real-time information on current storage volumes is located at realtimedata.waternsw.com.au

Significant events since 2021–22

Wet conditions have continued into the 2022–23 water year and a significant flood event has occurred. System inflows have been tracking well above historical averages since the closure of the reporting period. At the time of writing (February 2022) Burrinjuck and Blowering were 88% and 90% of full supply capacity respectively.

System reliability

The latest long-term planning model (Source) reflecting a water sharing plan management scenario in the Murrumbidgee provides indicative system reliability information for the commencement and closure of a watering season for General Security holders²⁰.

At the commencement of the water year, the long-term simulation shows that General Security licence holders receive a water availability of 97% for 1% of the time and exceed 58% for 50% of the time (Figure 46).

Availabilities for General Security significantly increase throughout the water year as storages are supplemented with new inflow. By the end of the water year, the simulation results indicate that a water availability of 100% is achieved, 44% of the time, 96% achieved 50% of the time and equalling or exceeding 35% for 97% of the time (Figure 47).

²⁰ Modelled data simulated as July to June water year. Simulation period 1 June 1890 to 30 June 2016, run rev.112

Figure 46: Start of water year simulated availability for General Security access licences

Figure 47: End of water year simulated availability for General Security access licences

Carryovers and available water determinations since this reporting period²¹

Note 1 – Allocation accounts

This note is reference for the volume held in the allocation accounts at the time of reporting but also relevant for the various processes that occur to either increase or decrease an allocation account throughout the water year.

The volume of water that is in the licence allocation accounts at the time of reporting is a net balance for the relevant licence category and represents that water that can be carried forward to the next water year as dictated by the carryover rules in place for that year or required under the water sharing plan.

A negative number for the carryover figure indicates that more usage has occurred than has been allocated to the account, and the deficit must be carried forward to the next season.

Water that is in accounts at the end of a water year but is not permitted to be carried over is forfeited and has been represented as a decrease in water liability. The accounting presented is relevant to licence category and therefore is inclusive of licences held by environmental holders (environmental holdings are specifically detailed in note 6)

Supplementary water was not strictly represented as a water liability in the accounting statements the same way other licence categories were. Details about supplementary usage and events can be found in Note 23.

Methodology

The carryover volume of water in the allocation account for each licence category is determined once all transactions and end of year forfeit rules have been applied. Below is list of typical transactions that can apply to an allocation account:

- available water determination (detailed in note 2)
- licenced usage (detailed in note 3)
- forfeiture due to:
 - carryover rules
 - account spillage as a result of AWD
 - licence conversions
- environmental allocation transferred for delivery outside of the Murrumbidgee (detailed in note 26).
- trade of allocation water between accounts (detailed in notes 4 and 5)
- determined carryover volume.

Additional information

Table 11 provides a balanced summary²² of the water allocation and environmental accounts for each category of access licence. Table 10 provides a description of each of the table components for Table 11 and Table 19.

Table 10: Explanatory information for Table 11 and Table 19.

Heading	Description
Licence category	An issued access licence category defined in the management areas water sharing plan. Typically, categories are specific purpose in nature (e.g. for town water supply), or reflect reliability in the resource sharing process (e.g. High Security)
Share	The total volume of units for the specified licence category at 30 June.
Opening balance	The volume of allocation that has been carried forward from the previous year to this accounting period
AWD	The total annual volume of allocation added to the access licences in the specified category by available water determinations (allocation announcements)
Lic New	Licences – New: Increase in account water as a result of issuing new access licences with an opening balance
Lic Can	Licences – Cancelled: Decrease in account water as a result of licence cancellation that was holding allocation
Asn In	Assignments – In: Increase in account water as a result of temporary trade in
Asn Out	Assignments – Out: Decrease in account water as a result of temporary trade out

²² Final accounting balances include adjustments to carryover, AWD, end of year forfeit and carry forward to allow for the effect of removing allocation account water from a Murrumbidgee access licence in order to call that water for release for Snowy River and Murray increased environmental flows. As a result these accounts will vary from provisional information available on departmental dashboards and from annual allocation summary data provided in the GPWAR (carryover item).

Heading	Description
Snowy trans	Transfer to Snowy for environmental release: Water transferred from Murrumbidgee allocation accounts to allow environmental flows in the Snowy, Snowy Montane and Murray Rivers. This physical delivery is allowed for by reducing the amount of water Snowy Hydro are required to release to the Murrumbidgee valley.
Usage	Account usage – Controlled: Volume of allocation debited to licences that is extracted or diverted from the river, or alternatively released from storage to support environmental outcomes. Allocation is supplied under controlled conditions through regulating structures such as dams and weirs.
Usage Uncont	Account usage – Uncontrolled: Volume of allocation debited to licences that is extracted or diverted from the river, or alternatively protected from extraction to support environmental outcomes. Allocation is supplied under uncontrolled flow conditions - either unregulated water sources, or from event flows in regulated systems unable to be captured in storage.
During year forfeit	This is the account water forfeited throughout the year as a result of the accounting rules specified in the water sharing plan. Forfeited water may occur due to account limits being reached, conversions between licence categories and various types of other licence dealings.
EoY Avail	Available Balance: That part of the remaining account balance that is available to be taken at the conclusion of the water year. The balance is prior to carry forward rules being applied.
EoY NA	Non-Available Balance: That part of the remaining account balance that is not available to be taken at the conclusion of the water year (30 June). The balance is prior to carry forward rules being applied.
EoY forfeit	End of year forfeit: Account water that is forfeited at the end of the water year as a result of carryover rules that restrict the carry forward volume to the next water year
Carry fwd	Carry forward: This represents the account water that is permitted to be carried forward into the next water year as determined by the carryover rules.

Table 11: Allocation account balance summary²². See Table 10 for explanation of headings.

Note 2 – Available water determination (allocation announcement)

This is the process by which the regulated surface water asset available for use within the regulated system is determined and shared. It determines the volume of water that is to be added to an individual's licence allocation account. Announcements of allocations are made on a seasonal basis – usually corresponding with the financial year and are updated on a regular basis or following significant inflow events. Under the *Water Management Act 2000* the announcements are termed available water determinations, while prior to this under the *Water Act 1912* this process was known as an allocation announcement.

Data type

Methodology

The AWD procedure itself is generally divided into 2 sections: the available water asset, and system commitments. Once system commitments have been met the available water asset is then available for distribution to the access licence categories in order of priority (see Table 12). The volume of the announced allocation is expressed as the percentage of share component of the licence.

Table 12: Priority of access licence categories

Licence Category	AWD Priority
General Security	Low
High Security	High
Conveyance	Low
Domestic and Stock ²³	Very High
Local Water Utility	Very High

Available water asset – this is calculated by summing the water currently available in storage, future (minimum) inflows to the system, and additional volumes due to recessions of inflows from the current levels to the minimum inflow levels. Also taken into consideration is the reduction of the total inflows to the system for those that arrive too late in the season to be useful.

System commitments – this is an assessment of the existing commitments that must be delivered from the Available Water Asset in either the current or future years. Key components include:

- essential supplies include things such as town water supplies, stock and domestic requirements, industrial use and permanent plantings (e.g. orchards, vineyards) and environmental allowances
- undelivered account water is the water that is already in accounts that is yet to be provided
- end of system flow requirement is an estimate of the flow that to pass through the system as a result of operation of the system
- losses which are estimated as the amount of water that will be lost by the system either through evaporation or in the process of delivering the water via transmission losses.

The AWD for supplementary licence accounts is a separate process and is not dependent on water asset available. It is made once at the start of the year and unless there is a management change due to the growth in use strategy it is maintained at the maximum value prescribed in the plan generally 100% of share component. Therefore, it is not considered to create a liability on the system and is only considered in terms of an extraction that reduces the water asset.

Additional information

The following pages contain the annual allocation summary report. Below is a table containing report notes to help interpret the report.

²³ Domestic and Stock is further broken down into three subcategories: Domestic and Stock, Domestic and Stock (Domestic) and Domestic and Stock (Stock). For the purposes of this report and the general-purpose water account they have been aggregated.

Table 13: Allocation summary report descriptions

Table heading	Description
Opening	Remaining allocation account balances at the conclusion of the previous season that can be carried forward to this season.
Individual announcement	Actual announcement made to each licence category
Share component (Entitlement)	Sum of the licensed volume of water within the licence category on the announcement date.
Announced volume	Volume of water credited to accounts within a licence category as a result of the announcement made.
Cumulative volume	Cumulative total of the announced volumes for the water year and licence category.
Percent of share component (Entitlement)	This is the announced volume expressed as a percentage of the entitlement applicable on the date.
Balance made available	Sum of water available in allocation accounts that has been made available to be taken during the season.
Non-available balance	Water allocated that is not accessible at this point in time.
Supplementary water	Water that is not a stored source of water and is only made available if an uncontrolled flow event occurs.

Note 3 – Allocation account usage

This is the volume of water that is extracted, diverted or measured as usage and is accountable against an access licence issued under the water sharing plan. This figure excludes that water accounted as uncontrolled flow which is accounted for separately (see Note 23).

Data type

Measured/administration data

Policy

Water Sharing Plan for the Murrumbidgee Regulated River Water Source 2016

Available on the department's website at www.industry.nsw.gov.au/water

Data accuracy

A – Estimated in the range +/- 10%

Providing agency

Department of Planning and Environment

Data source

WaterNSW/ Department of Planning and Environment – Water Accounting System (Joint ownership of system).

Methodology

Usage information is determined by either on-farm meters that measure extraction, gauges on diversion works or orders/releases when the volume cannot be effectively metered, such as an environmental watering event.

Meter readings are collected for individual licence holders at intervals during the year and converted via a calibration factor to a volume of water extracted. Water diverted from the river is measured by recording the height at either the gauge or weir with the volume diverted being derived by passing these heights through a rating table. With potentially multiple categories of access licences being extracted through the same pumps additional information and methodologies are required to separate use under the various licence categories. Below is a description of these:

- based on periods of announcement – during periods of supplementary water announcements extractions can be debited against the supplementary water licences
- usage based on water orders – users place orders for water against an access licence and usages are debited against accounts in proportion to the orders placed.

licence category apportionment – if no water orders are available water extracted is apportioned against categories of access licence in order of priority as set out in the table below. The prioritising is based on the nature of and rules around each of the licence categories. Table 15 provides the order in which extractions are apportioned to access licence categories in the water accounting system. This is a generic list where not all categories will necessarily appear in this GPWAR. There are also various sub-categories of licence associated with some of the categories.

Table 15: Licence category metered usage apportionment table

Methodology

Trading is permitted between certain categories of access licences and between certain water sources. This is detailed in the water sharing plan or stipulated under the licence holder's conditions.

The net effect of internal trading on committed water is zero for a water year. However, these trades are listed in the accounting statements to provide details on the volumes of water traded.

Trade between water sources will either increase the committed liability for the year (trade into the Murrumbidgee) or decrease the committed liability for the year (trade out of the Murrumbidgee). The imbalance created from trading between water sources is monitored and managed with the intervalley trade account (see note 5).

Additional information

Table 17 shows the internal trading figures between licence categories. All figures represent a volume in megalitres.

Total internal trading = 1,526,426 megalitres.

Note 5 – Intervalley Trade Account (IVT)

The intervalley trade account provides ongoing tracking of valley debts and claims to water due to the temporary trading of account water between the southern connected valleys of the Murray–Darling Basin.

For the Murrumbidgee this is presented in the accounting statements as a liability account²⁵ whereby a positive balance is indicative of a future obligation (Murrumbidgee owes water). and a negative balance indicative of a claim to water (Murrumbidgee owed water).

Methodology

The balance of the IVT account is calculated by adjusting the carried forward balance of the IVT account from the previous year and applying a series of transactions to the account as outlined below. A positive balance indicates that the Murray System owes water to the Murrumbidgee System while a negative balance indicates that Murrumbidgee System owes water to the Murray System.

1. The volume of water traded into the Murrumbidgee Valley from the NSW Murray, NSW Lower Darling, Victoria or South Australia will result in the IVT being decreased
2. The volume of water traded out of the Murrumbidgee Valley to the NSW Murray, NSW Lower Darling, Victoria or South Australia will result in the IVT being increased
3. The Murray–Darling Basin Authority (MDBA) requests that NSW deliver a proportion of the water that was traded to users outside of the Murrumbidgee. NSW supplies the requested volume and accounts for it by calculating the resulting addition volume of water passing the Murrumbidgee River at Balranald. The accounted volume supplied is agreed between WaterNSW and MDBA and the IVT account is increased accordingly.
4. On occasion Snowy Hydro Limited may be requested to transfer a portion of either the Murrumbidgee or Murray Required Annual Release (RAR) to assist with the settlement of the IVT account when it gets too far out of balance (although there is no legal obligation on them to perform such releases). These are often referred to as "notional" releases. The following points illustrate this process:
 - Excessive Trade from Murrumbidgee to Murray creates a need to transfer Murrumbidgee RAR via the Murray development thus reducing the IVT account (reducing Murrumbidgee debt to Murray).
 - Excessive trade from Murray to Murrumbidgee creates a need to transfer Murray RAR via the Murrumbidgee development thus increasing the IVT account (reducing Murray debt to Murrumbidgee).
5. Tagged trading is a dealing that occurs when a licence holder within a valley nominates to extract their allocation for that licence from a different water source. Any water delivered to a point of extraction within the Murrumbidgee to meet allocation associated with another water source therefore results in a decrease to the IVT.
6. During periods of high summer demand transfers of water can occur from the Murray to the Murrumbidgee via Murray Irrigation Limited (MIL) infrastructure to bypass delivery constraints in either the Murray (caused by the Murray choke) or the Yanco Creek System and the Coleambally Irrigation channel network. Water passed into the Murrumbidgee via MIL, subject to MIL ability to deliver via their channel system, can help to meet the demands in Billabong Creek. The net change in the IVT as a result is calculated by assessing the

difference between the flow diverted from MIL to Billabong Creek (via Finley escape) and the water that leaves the Murrumbidgee via the Billabong Creek at Darlot for the corresponding period (i.e. estimating volume extracted by users on Billabong Creek). This figure is presented as 'Finley Borrow' in Table 18.

7. A spill process has also been integrated to implementation the Murrumbidgee IVT, that may reduce or eliminate the current IVT balance when Murrumbidgee storages are spilling. The decision whether to spill IVT considers the relative water availabilities of the NSW Murray and Murrumbidgee at the time of spill.

Additional information

The IVT Trade balance summary table provides information compiled from the best information available at the time of publication. These figures may change in the future as updated information becomes available. All figures in the table are in megalitres.

The note references in the table refer to the numbers associated with the text in the methodology above. The presentation of the IVT has been revised in the 2017–18 GPWAR to represent the IVT commitments as a liability on the resource (previously an asset). This means a positive IVT balance results in the Murrumbidgee owing water.

Note 6 – Held environmental water

This represents that environmental water that is held as part of a licensed volumetric entitlement. These licences are held within the same licence categories as all other water access licences and are subject to the same operating rules. Therefore, they are subject to the following key rules:

- available water determinations (AWD) for their share of the entitlement to be added to accounts
- carryover rules – the forfeiting of unused water that cannot be carried over
- provide water orders prior to use.

These licences are used to provide environmental benefit and outcomes to the catchment by either providing water to, or supplementing water requirements of, a specific environmental events or incidents. On occasion the environmental benefit is achieved by trading the water as opposed to ordering and recording the subsequent usage against the licence.

Data source

WaterNSW/Department of Planning and Environment – Water Accounting System (Joint ownership)

Methodology

The water held for the environment represents a volume of water in corresponding allocation accounts. This allocation account represents the sum of the remaining volume of held environmental water at the conclusion of the water year once all transactions and forfeit rules have been applied to the accounts. These environmental balances are at the licence category level and represent the water that can be carried forward for use in the next year. Below is list of typical transactions that can apply to an environmental allocation account:

- AWD (including pro rata of AWD for new licences)
- licensed extractions
- forfeiture due to:
 - carryover rules
 - account spillage as a result of AWD
 - licence conversions
 - excess orders (where water order debiting is in place)
- trade of allocation water between accounts.

In addition, the trade and purchase of environmental water is tracked to capture the movement of environmental entitlement both in number of entitlements, and volume.

Additional information

Table 19 provides a summary of held environmental water for the reporting period. Definitions for the processes represented in the summary are defined in Table 10.

Table 20 presents changes to environmental holdings since the previous reporting period.

Table 21 presents trading of temporary water associated with environmental holdings. While environmental holdings occasionally trade to non-environmental holders to achieve delivery of environmental water, this report is presented from a perspective of watering purpose i.e. a trade from an environmental holding to a non-environmental holding has transferred the expected use of that water to a consumptive purpose.

²⁶ The account balance summary includes all licences where the registered holder or part holder is a government department, and the held component is wholly managed for environmental benefit. Water that has been purchased from consumptive users but yet to be moved out to a government holding is not identified in this summary. Generally, in the situation the water is temporarily trade out to an environmental licence until the settlement has been finalised.

Note 7 – Environmental provisions

These were introduced as part of the water sharing plans with the aim of enhancing environmental benefits. They consist of a series of rules established around the concept of dam translucency and transparency releases, environmental water allowances (EWA), provisional storages and balancing storages and end of system flows. Below is a brief description of these.

Dam transparency – protects low flows immediately downstream of Burrinjuck and Blowering Dams by passing all inflows up to a defined limit.

Dam translucency – ensures that some degree of natural flow variability is restored downstream of Burrinjuck Dam by releasing a proportion of inflows based on the time of year and the catchment conditions.

End of system flows – maintain a flow of water to the end of the Murrumbidgee River and Billabong Creek ensuring its connectivity with the Murray River.

Environmental water allowances – three water allowances were created to provide direct benefits to the environment. The water is for discretionary environmental management such as wetland inundation, flushes to improve water quality, or providing habitat for waterbird breeding.

Provisional storage volumes – two provisional storage volumes are provided with the intent to increase the size and frequency of spill events for environmental benefits.

Daily release balance – this account maintains a record of the net difference between the minimum transparent dam release and the water credited to environmental water allowance (EWA2 allowance). The daily release balance (DRB) was introduced at the commencement of the water sharing plan to allow the existing translucent and transparent releases to be adopted while also providing for adaptive water. The DRB increases when transparent water releases are made triggering credits to the Environmental Water Allowance 2 (EWA2). The DRB balance is then used to reduce future requirements of translucent water releases.

For additional details on this refer to the environmental rules in the water sharing plan.

Methodology

Methods for evaluating the environmental provisions can be found in the water sharing plan.

Transparency releases from Blowering Dam could not be implemented as data for Blowering Dam natural inflows on a daily basis are unavailable. As such it has been treated as a minimum storage release figure of 560 megalitres per day and are not accounted for separately within this GPWAR.

The following tables show account summaries, water deliveries and balances for those accounts established as a result of the environmental provisions as set out in the water sharing plan.

Additional Information

The following group of tables provides a comprehensive summary of the Planned Environmental Water since the commencement of the water sharing plan.

²⁸ Total release has been recalculated for historical period in this GPWAR. The release is calculated as the total flow at Murrumbidgee River downstream of Burrinjuck Dam (410008). Missing data has been filled with the operator release information (410131)

³² For specific details about the rules around PSV please refer to the water sharing plan.

³³ When general security AWD plus carryover volume exceeds 0.6 megalitres/share PSV1 receive 50,000 megalitres plus an additional 8,750 megalitres for every additional 0.01 megalitres/Share of AWD plus carryover volume in excess of 0.8 megalitres/share.

³⁴ When general security AWD plus carryover volume exceeds 0.8 megalitres/share and requirements for EWA3 and PSV1 have been met any additional excess volume can be credited to PSV2 up to a limit of that water that was forfeited the previous year.

³⁵ From 1 November when general security AWD plus carryover volume exceeds 0.8 megalitres/share the PSV2 account is credited up to a maximum limit of the sum of water not credited to EWA3 in the current year and any water that was not credited in the previous year.

³⁶ Between 1 Nov and 31 Decr EWA3 is credited with 50% of forgone translucent releases when AWD plus carryover volume exceeds 0.8 megalitres/share. The PSV2 account is credited with the other 50%.

³⁷ Water is moved from the EWA3 account to the PSV2 account 2 times each year. On the 1st November 50% of remaining account water is moved with any remaining account water moving on 1st January.

³⁸ Under Release water delivered to meet environmental requirements.

³⁹ Total volume of water delivered for environmental purposes from planned environmental water provisions set aside in Burrinjuck Dam. It is the sum of EWA1 delivered, EWA2 delivered and Under Release delivered (does not include translucency/transparency releases).

⁴⁰ The Water Sharing Plan was suspended on 9 November 2006 and was not reinstated until 16 September 2011.

Table 27: End of year balances for total EWA, DRB and translucency/transparency under release

2021-22	68,701	0	23,900	2,320	67,107	82,656	0	(17,790)

⁴¹ Under Release is that water that was not delivered under the Translucent/transparent release rules in the Plan that will be paid back at a later date. The Under Release balance was zeroed once water sharing plan suspended.

⁴² DRB balance was zeroed on 4 August 2012 to balance the borrowed volume accumulated since 1 July 2004. The figure used to zero accounts was 87,886 and was calculated based on corrected historical calculations of under release. These historical corrections have been retrospectively applied in the table.

Note 8 – Snowy required annual release

Snowy Hydro Limited operates under a May to April accounting year, which is different to the water accounting period being considered in this report. Hence, this note will cover both the Snowy RAR and those adjusted to represent the reporting period.

Snowy Hydro Limited provides an annual fixed minimal accountable release, known as the Required Annual Release (RAR) to the Murrumbidgee (1,026,000 megalitres per year). However, in years of severe drought when the current inflow sequence is worse (drier) than the historical dry sequence, Snowy Hydro delivery of the RAR could put the Snowy Scheme at risk of running out of water. In those years the RAR may be reduced by the Dry Inflow Sequence Volume (DISV) being the measure of the cumulative difference between the historic dry sequence and the current inflow sequence. Any shortfall in the delivery of the DISV will be repaid in the future when annual inflows improve.

Further adjustments to the RAR can also be made each year as a result of pre-releases made in the previous year or for water savings in the Murrumbidgee that have been dedicated to Snowy River environmental flows. The RAR and those items that adjust it are monitored continually and updated whenever changes in the catchment dictate it.

The RAR delivered is assessed as Accountable Net Jounama Releases being the sum of:

- actual releases from Tumut 1 Power Station
- total montane release
- increase in storages at Talbingo and Jounama.

Montane release is environmental water to support the high-altitude streams that have been impacted by the Snowy Mountains Scheme. It is diverted to Burrinjuck Dam catchment with the majority lost before reaching the dam (hence, it is not separated out in statements for the Burrinjuck Dam inflows). The figure used for the accountable portion of Blowering Dam inflows in the accounting statements excludes Montane releases.

Department of Planning and Environment

Data sources

Snowy Mountains Authority Water Operations Report

Methodology

Snowy Hydro inflow to Blowering Dam

Inflow delivered to Blowering Dam from Snowy Hydro infrastructure for reporting period (July–June) is assessed as:

- Delivered RAR (Sum accountable Net Jounama releases) less Montane release

Snowy RAR Accounting (May–April)

RAR Deliverable for Snowy–Tumut Development is calculated as being:

- Annual fixed RAR
- **plus** DISV as at 1 March (previous water year)
- **less** water savings allocated to Snowy Tumut
- **less** pre-release (previous water year)

Adjusted RAR for Snowy–Tumut Development is calculated as being:

- RAR Deliverable
- **less** DISV on 1 March (water year)
- **less** Murrumbidgee water deal paybacks
- **less** RAR permitted shortfalls and relaxations
- **less** Snowy-Tumut intervalley transfer settlement

Total RAR Delivered = Adjusted RAR plus Pre-release (next water year) plus Above Target Release

Additional Information

Table 28 provides a breakdown of the total estimated inflow to Blowering storage to the volume delivered from Snowy Hydro infrastructure, and the additional natural inflow component. The information is presented for the reporting period and historical (July to June). Table 29 provides a summary of the RAR accounting which is implemented on a May to April water year.

Table 28: Blowering Dam inflow sources

Water year	Total Blowering inflow estimate	Delivered from Snowy Hydro infrastructure	Additional inflow/natural
2008–09	618,281	409,713	208,567

2021-22	485,000	200,000	248,000

⁴³ Includes RAR deliveries to snowy montane rivers and to Blowering storage

Note 9 – Prior year account adjustment

This is a line item that is used to correct balances in the accounts. The double entry accounting being applied is a continuous process whereby the closing balance of one year is the opening balance for the following year. Occasionally corrections will be required for a variety of reasons including when an error is identified in prior year reporting or when a process that had previously been reported is unable to be supplied and the associated asset or liability must be removed to maintain the integrity of the statements. This is different to the unaccounted difference component which is a physical volume required to achieve mass balance after all the known processes have been accounted.

Data type

Calculated

Accuracy

A1 – Nil inaccuracy +/- 0%

Providing agency

Department of Planning and Environment

Data source

Not applicable

Methodology

A journal transaction is placed at the closing of the previous water year to either increase or decrease and account balance to align with the correct opening balances of the reporting year.

Additional Information

No prior year adjustment was required for the reporting period.

Note 10 – Surface water storage

This is the actual volume of water stored in the individual surface water storages at the date of reporting. The volumes provided represent the total volume of water in the storage, including dead storage which is the volume of water which can't be accessed under normal operating conditions e.g. volume below low-level outlet. It is assumed that the dead storage can be accessed if required via alternative access methods e.g. syphons.

Data type

Data accuracy

A – Estimated in the range +/- 10%

Providing agency

Department of Planning and Environment

Data source

Department of Planning and Environment – HYDSTRA

Methodology

Storage volumes are calculated by processing a gauged storage elevation through a rating table that converts it to a volume.

Additional Information

The following table provides a breakdown of the storage capacities and dead storages.

Table 30: Capacity and dead storage summary table

Name	Capacity (ML)	Dead storage (ML)
Burrinjuck Dam	1,026,330	3,250
Blowering Dam	1,631,410	23,990
Berembed Weir	3,380	120
Gogeldrie Weir	7,400	200
Hay Weir	14,300	1,000
Maude Weir	8,028	300
Redbank Weir	5,580	400
Tombullen Storage	11,230	372
Total	2,704,470	29,632

Note 11 – River channel storage

The volume of water stored in the river channel on the day of reporting.

Policy

Not applicable

Data type

Derived from measured data

Data accuracy

B – Estimated in the range +/- 25%

Providing agency

Department of Planning and Environment

Data sources

Department of Planning and Environment: HYDSTRA, CAIRO

Methodology

For each river section S(n):

$$V = Q \times T$$

The river channel storage will be equal to the sum of all river section volumes.

$$\text{River channel storage} = \sum S(n) V$$

Table 31: Summary of river volume calculation components

Symbol	Variable	Data Source	Unit
Q	Average flow in the river section. Calculated by averaging the daily flows at the upstream and downstream river gauges.	HYDSTRA	ML/d
V	Volume in each river section.	Calculated	ML
T	Average travel time for a parcel of water to travel through the river section.	CAIRO	days

Assumptions and approximations:

- Travel times are estimated to the nearest day.
- Daily flow change between gauging sites assumed to be linear.

Note 12 – Storage inflow

Storage inflow refers to the volume of water flowing into the major headwater storages – Burrinjuck and Blowering Dams or the off-river, reregulating storage of Tombullen. The storage inflow for Blowering Dam has been sub-categorised Snowy Accountable, Snowy Pre-release and Other/Natural.

Snowy accountable is inflow accredited against the Required Annual Release (RAR) from Snowy Hydro and pre-release is water that has been released on top of those requirements and will be accredited to the required annual release in the next season. Other/Natural includes natural runoff from the surrounding Blowering catchment, and any water released from Snowy that was not allowed to be accredited as RAR water. Further information on RAR is available in Note 8.

Policy

Not applicable

Data type

Derived from measured data

Data accuracy

A – Estimated in the range +/- 10%

Providing agency

Department of Planning and Environment

Data sources

Department of Planning and Environment: HYDSTRA, SILO (Queensland government climatic information)

Methodology

For Blowering and Burrinjuck storages there is no direct measurement of inflows. However, it is possible to calculate inflows by using a mass balance approach (based on balancing the change in storage volume) where inflow is the only unknown. This is referred to a back-calculation of inflows. The back-calculation figures were derived using a one-day time step with the inflow calculated according to the equation below. The daily inflows are then summed to provide an annual inflow figure.

$$I = \Delta S + O + Se + ((E - R) * A) / 100$$

Table 32: Components for back-calculation of inflow

Symbol	Variable	Unit
I	Inflow	ML/day
ΔS	Change in storage volume	ML
O	Outflow	ML/day
Se	Seepage	ML/day
R	Rainfall	mm/day
E	Evaporation (Mortons shallow lake estimation, SILO)	mm/day
A	Surface area – derived from height to surface areas lookup curve	ha

Assumptions and approximations:

- Seepage was assumed to be zero.
- For Tombullen storage, where inflows are regulated by diverting flow from the main river inflow is measured. The flows are obtained by measuring river heights at gauging stations along the river, and then passing these heights through a rating table that converts them to a daily flow volume. Inflow reported in this GPWAR was obtained directly from the river operations spreadsheet (CAIRO).

Note 13 – Storage evaporation and storage rainfall

For the major storages of Burrinjuck and Blowering, this refers to the water that is either lost as a result of evaporation or gained as a result of rainfall. For Tombullen storage, only a net evaporation is presented which is an estimate of the combined effects of rainfall and evaporation on the storage.

Data type

Derived from measured data

Policy

Not applicable

Data accuracy

B – Estimated in the range +/- 25%

Providing agency

Department of Planning and Environment, WaterNSW

Data source

Department of Planning and Environment – SILO (Queensland government climatic information), HYDSTRA, CAIRO

Methodology

Burrinjuck and Blowering storages

Daily rainfall and Mortons shallow lake evaporation data (accessed via SILO) are applied to storage surface area time-series from HYDSTRA to achieve a volume in megalitres which is then aggregated to an annual figure. The rainfall and evaporation data utilised is equivalent to the data used in the storage inflow back-calculation (note 12).

Rainfall:

$$\text{Volume (ML)} = \text{Rainfall (mm)} \times \text{Area (m}^2\text{)} \times 10^{-6}$$

Evaporation:

$$\text{Volume (ML)} = \text{Mortons shallow lake evaporation (mm)} \times \text{Area (m}^2\text{)} \times 10^{-6}$$

Tombullen storage

For Tombullen a simple, annual mass balance was calculated for the storage, whereby the known components are inflow, volume, and outflow (measured data obtained from CAIRO). The volume required to achieve mass balance is therefore assumed to be the volume of net evaporation from the storage.

$$\text{Net Evaporation} = \text{storage change (ML)} + \text{storage release (ML)} - \text{storage inflow (ML)}$$

Note 14 – Gauged tributary inflow, other inflow

The inflow into the regulated river that occurs downstream of the headwater storages that is measured at known gauging stations.

Policy

Not applicable

Data type

Measured data

Data accuracy

A – Estimated in the range +/- 10%

Providing agency

Department of Planning and Environment

Data sources

Department of Planning and Environment: HYDSTRA, WaterNSW: Murray Irrigation operational accounting

Methodology

The flows are obtained by measuring river heights at gauging stations along the river, and then passing these heights through a rating table that converts them to a daily flow volume.

Additional information

The total gauged inflow for the reporting period is the sum of the inflows for the gauged tributaries defined in the table below.

Table 33: Summary of gauged tributary inflow

Station	Station name	Area (km ²)	Volume (ML)
410057	Goobarragandra River at Lacmalac	673	478,091
410025	Jugiong Creek at Jugiong (Inverlockie)	2,120	162,594
410044	Muttama Creek at Coolac	1,025	66,264
410038	Adjungbilly Creek at Darbalara	391	125,759

Methodology

To derive an estimate a simple mass balance approach was adopted whereby known inflows and outflows were combined with an assumed loss factor. No estimate was made for the area below Narrandera or the Yanco Creek system and aquifer interaction has been excluded from the calculation.

$$U_{\text{Inflow}} = G_{\text{Narrandera}} - R_{\text{Burrinjuck}} - R_{\text{Blowering}} - G_{\text{Inflow}} + U_{\text{Narrandera}} + L_{\text{estimate}}$$

Where:

- U_{Inflow} = Ungauged Inflow to Narrandera (excluding Yanco Creek system)
- $G_{\text{Narrandera}}$ = Gauged flow at Murrumbidgee River at Narrandera
- $R_{\text{Burrinjuck}}$ = Total release from Burrinjuck Storage
- $R_{\text{Blowering}}$ = Total release from Blowering Storage
- G_{Inflow} = Total gauged inflow to Narrandera (excluding Yanco system)
- $U_{\text{Narrandera}}$ = Total extractions to Narrandera (excluding Yanco system extractions)
- L_{estimate} = Estimate of losses in target reach. Assumed to be 10% of all water entering.

Note 16 – River evaporation and river rainfall

This refers to the volume of water effective on the accounted river reach that is either lost as a result of evaporation or gained as a result of rainfall.

Data type

Policy

NA

Data accuracy

B – Estimated in the range +/- 25%

Providing agency

Department of Planning and Environment

Data source

- Department of Planning and Environment: HYDSTRA, ARCGIS
- QLD Department of Natural Resources: SILO

Methodology

The volume applied for evaporation and rainfall on the regulated river is achieved by first calculating a daily time-series of river area. This is achieved by breaking the river up into reaches and utilising the cross sections recorded at river gauging locations to determine the average width of the river with a given daily flow. River length is then determined between two gauging locations using ARCGIS and as such an area for each reach can be defined.

$$\text{Area (m}^2\text{)} = \text{Average W (m)} \times \text{L (m)}$$

Where W is the daily width determined from the gauging cross sections and L is the length as determined through ARCGIS analysis.

With daily area determined, various climate stations are then selected based on their proximity to each river reach. Rainfall and evaporation data are then extracted from SILO and applied to the area time-series to achieve a volume in megalitres which is then aggregated to an annual figure.

Rainfall:

$$\text{Volume (ML)} = \text{Rainfall (mm)} \times \text{Area (m}^2\text{)} \times 10^{-6}$$

Evaporation:

$$\text{Volume (ML)} = \text{ET}_0 \text{ (mm)} \times \text{K}_c \times \text{Area (m}^2\text{)} \times 10^{-6}$$

Where:

- ET_0 = reference evapotranspiration from SILO
- K_c = crop factor for open water (1.05)

Note 17 – Return flows (including re-credit)

Return flow is that flow that has left the river and returns further downstream. The returning flow is less than what leaves the river. It can also include return flows from catchment drains within the irrigation corporation areas.

In certain circumstances in the Murrumbidgee water is delivered through Coleambally Irrigation catchment drains in order to meet demand in Yanco Creek system during peak flow periods. In these circumstances the return flow provided through Coleambally Irrigation will be accountable and is credited back to the appropriate allocation account. All other return from drainage is non accountable.

Re-credits are also given to Coleambally Irrigation for any flow diverted to Tombullen storage, a re-regulating storage beside the Murrumbidgee River, whereby water is diverted to the storage via the Coleambally main canal. Accounted usage in this GPWAR, detailed in Note 3, provides the net usage after any recredits have been applied.

Data type

Measured

Policy

NA

Data accuracy

- Recredit – A1 - Nil accuracy

Providing agency

Department of Planning and Environment

Data sources

- Murrumbidgee Irrigation Licence Compliance Report
- Coleambally Irrigation Annual Compliance Report
- WaterNSW irrigation corporation operational accounting

Methodology

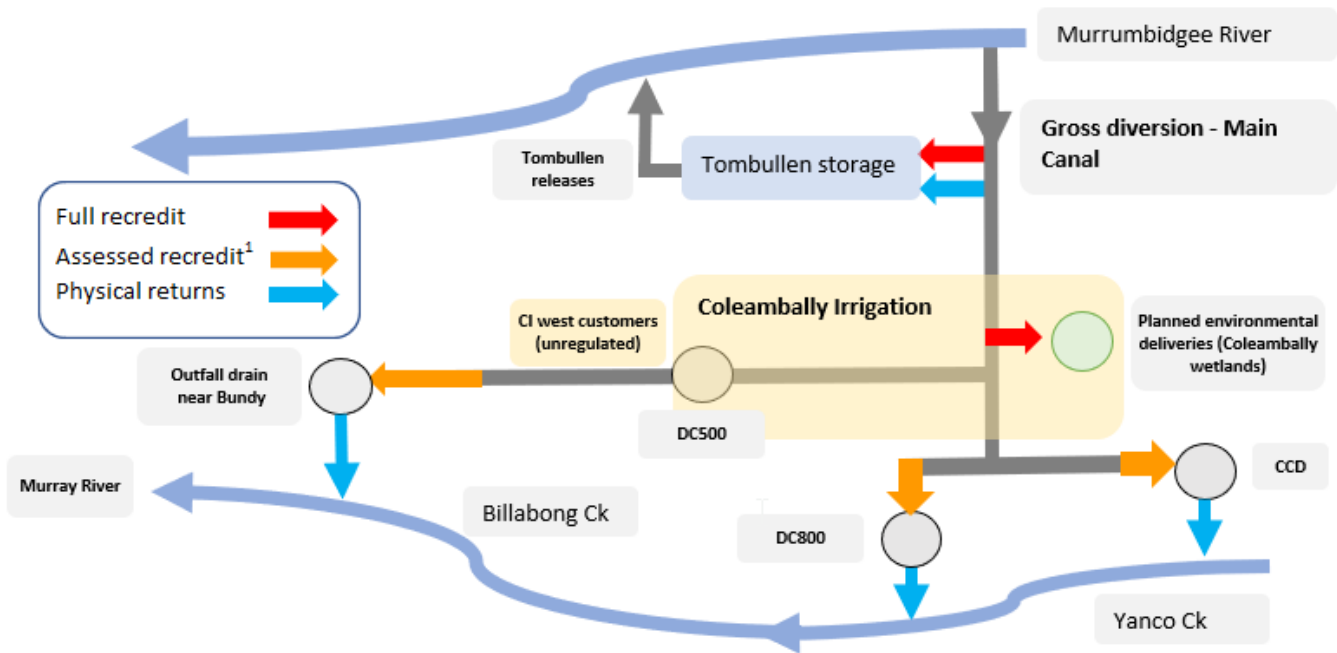

The return flows are measured in the same way as the gauged inflows, that is by measuring river heights at gauging stations along the river, passing these heights through a rating table that converts them to a flow or alternatively using a flumegate installed in the open channel. The total return flow is the sum of the flows for all the return flow gauges.

Additional information

Table 35: Return flow summary table (includes flow passed to Tombullen storage)

Year	Coleambally Irrigation Main Canal diversion	Coleambally Irrigation Total recredits ⁴⁵	Coleambally Irrigation Physical returns ⁴⁶	Murrumbidgee Irrigation Physical return
2021-22	324,935	63,019	70,645	1,708

Figure 51: Conceptual diagram for Coleambally Irrigation re-credits

1. Assessment is determined based on requests to pass flow for downstream use (by the river operator to Coleambally Irrigation)
Conveyance losses are also considered in determining the allocation recredit

⁴⁵ Recredits for water moved to Tombullen, planned e-water deliveries, or ordered water passed through drains including allowance for conveyance loss

⁴⁶ Inflows to Tombullen storage plus flows at outfall drain near Bundy, DC800, CCD

Note 18 – Dam releases, river inflow from dam releases

The volume of water released from Burrinjuck and Blowering Dams, and Tombullen (off river storage) to meet downstream requirements. Releases for Burrinjuck have been sub-classified into Translucent, Transparent or other (the remaining) releases. In the accounting process releases have been represented as both a decrease in asset (of the dams) and an equal increase in asset (the river).

Policy

Data type

Measured data

Data accuracy

A – Estimated in the range +/- 10%

Providing agency

Department of Planning and Environment

Data sources

- Department of Planning and Environment – HYDSTRA
- WaterNSW – Daily Environmental Operational Spreadsheet

Methodology

The flows are obtained by measuring river heights at a gauging station downstream of the dam wall, and then passing these heights through a rating table that converts them to a daily flow volume. The gauges used were 410102 (Tumut River at Blowering Dam) and 410008 Murrumbidgee River at D/S Burrinjuck Dam. The total Burrinjuck release was disaggregated using daily operational spreadsheet tags of transparent and translucent releases.

Additional information

Table 36 provides a breakdown by component of the accounted storage releases for the reporting period.

Table 36: Summary of releases for the reporting period (ML)

Storage	Translucent Release (ML)	Transparent Release (ML)	Other Release (ML)	Total release (ML)
Burrinjuck Dam	861,444	659,585	2,175,280	3,696,309
Blowering Dam	-	199,635	930,575	1,827,810
Tombullen	-	345,499	-	345,499
Total increase to river (ML)	-	-	-	5,599,203

Figure 52: Daily releases from Burrinjuck and Blowering storages (reporting period)

Data accuracy

A – Estimated in the range +/- 10%

Providing agency

Department of Planning and Environment

Data source

Department of Planning and Environment – HYDSTRA

Methodology

Summation of flows at gauging station/s measuring the volume of water that leaves the entity. For the Murrumbidgee reporting entity this is represented by the following gauges:

- 410134 Billabong Creek at Darlot
- 410003 Murrumbidgee River at Balranald

These gauges record the time series of heights which are converted to a volume of water based on a derived 'height to flow' relationship (rating table).

Under the water sharing plan minimum flow targets also exist at these end of system gauges.

Additional Information

Figure 54 and Figure 55 provide details of the daily flows in comparisons to both the minimum flow targets and the required flow targets. The required flow targets are made up of the minimum targets plus any other downstream requirements such as demand, environmental water requirements or inter-valley trade delivery requirements. A truncated plot is provided for each site to provide a clearer view the minimum flow target.

Figure 54: Murrumbidgee River at Balranald flow and target

Figure 55: Billabong Creek at Darlot flow and target

Note 20 – Diversions to Lowbidgee

The Lowbidgee is the largest area of floodplain wetland remaining in the Murrumbidgee catchment. It is located between Maude and Balranald and covers an area over 2,000 square kilometres. The Lowbidgee includes the second largest red gum forest in Australia and significant black box, lignum and reed-bed communities. The lower Murrumbidgee floodplain wetlands have a strategic role in the health of the Murray–Darling river system and are significant at a national and international level.

Water Sharing Plan for the Murrumbidgee Regulated River Water Source 2016

- Part 9 Rules for managing access licences
 - Division 2 Access to supplementary water and taking water without debit rules
 - Clause 69 Taking of water under supplementary water access licences and supplementary (Lowbidgee) access licences
 - Clause 70 Distribution rules for the Lowbidgee area

Available from Department of Planning and Environment website at www.industry.nsw.gov.au/water

Data accuracy

A – Estimated in the range +/- 10%

Providing agency

Department of Planning and Environment

Data source

- Department of Planning and Environment – HYDSTRA
- WaterNSW – annual compliance report

Methodology

The total diversion to Lowbidgee is calculated by summing the flows diverted down three canals off Maude Weir and four Regulators off Redbank Weir.

Note 21 – Extractions from river

For surface water, this refers to the actual volume of water directly pumped or diverted from the regulated river by licence holders. Occasionally, (generally in the case of environmental water) volumes are ordered against a licence account for in-stream benefits or for end of system flow events. The volume physically extracted from the river will not always be equal to the amount of water debited to accounts for usage, which has been reported in detail in Note 3. The figure also excludes basic rights extractions, which is reported as a separate line item and detailed in Note 22.

Data type

A – Estimated in the range +/- 10%

Providing agency

Department of Planning and Environment

Data source

- WaterNSW/ Department of Planning and Environment – Water Accounting System (Joint ownership of system).
- Department of Planning and Environment – Water Ordering and Usage database

Methodology

For the purposes of this GPWAR extraction from the river is considered to be the total volume metered and debited to the allocation accounts minus any water that can be identified as being used within the system or ordered to be passed through the system. These volumes are generally associated with environmental water orders and have already been accounted for in other line items. Extractions from river included that diverted to an irrigation corporation for distribution.

Additional information

Table 37 provides a reconciliation of the accounted usage against access licences compared to the extraction from river volume presented in the water accounting statements.

Table 37: Reconciliation of account usage to physical extractions from the accounting extent

Item	Volume (ML)
Total account usage (A)	2,191,465
Volume account usage to Lowbidgee (disclosed in another item) (B)	105,254
Total CI account usage (C)	261,916
Volume of usage leaving accounted extent (account usage downstream Balranald or Darlot, already accounted in flow leaving) (D)	19,710
Extraction Coleambally Main Canal (F)	324,935
Total extractions (A-B-C-D+F)	2,129,520

Note 22 – Basic rights extractions

This is the non-licensed right to extract water to meet basic requirements for household purposes (non-commercial uses in and around the house and garden) and for watering of stock. It is available for anyone who has access to river frontage on their property.

This water cannot be used for irrigating crops or garden produce that will be sold or bartered, for washing down machinery sheds or for intensive livestock operations.

In times of limited supply, there may be restrictions on taking water for domestic and stock use.

Data accuracy

C – Estimated in the range +/- 50%

Providing agency

Department of Planning and Environment

Data source

Water Sharing Plan for the Murrumbidgee Regulated River Water Source 2016

Methodology

The estimation of domestic and stock rights uses a series of estimates for water usage, stocking rates, population and property shape based on local knowledge to calculate riparian (stock and domestic) requirements in megalitres per year. The annual extraction for Domestic and Stock rights in the water accounts is assumed to be the estimated figure stated in the Water Sharing Plan for the Murrumbidgee Regulated River Water Source 2016 (1,690 megalitres).

Note 23 – Supplementary/Uncontrolled Flow extractions

This is the volume of water extracted, diverted or delivered under supplementary access licences and uncontrolled flow rules during announced periods of supplementary water. Supplementary flow events are announced periodically during the season when high flow events occur with the period of extraction and volume of water to be extracted determined based on the rules as set out in the water sharing plans. It is important to note that supplementary access licences differ from other categories of access licence in that the volume of water announced in the available water determination account refers to an annual upper limit for extractions and its provision is totally reliant on the occurrence of high flow events. In addition to supplementary water access being available during the supplementary flow events uncontrolled flow (if available) is also accessible against general security licences (see Note 23 for more detail on uncontrolled flows).

In 2012-13 a new category of licence, Supplementary (Lowbidgee), was introduced under WMA2000 to convert land (area) based rights to a volumetric entitlement.

For this GPWAR the actual amount of Supplementary water taken during the year has been displayed as both an increase in water liability (demand to take from an announced event) and an equal decrease in water liability (reduction in supplementary holders account for physical extractions), the net effect is zero system on the system liability and a decrease in the systems total water assets. No other processes for supplementary water (available water determinations, trading etc) were considered in the accounting process.

Uncontrolled Flow refers to a specific volume of non-debit water, as defined in the water sharing plan, pumped or diverted from the river for consumptive use by general security licence holders during periods when the extraction of supplementary water is permitted. It differs from supplementary water, which is a defined licence category that limits the volume pumped during high flow events, in that based on rules defined in the water sharing plan it can debit the licence holders general security account.

A – Estimated in the range +/- 10%

Providing agency

Department of Planning and Environment

Data source

WaterNSW/ Department of Planning and Environment – Water Accounting System (Joint ownership of System).

Methodology (Supplementary water)

Supplementary and uncontrolled flow water extraction and diversion data is collected by either on farm meters that measure extraction or gauges on diversion works. Meter readings are collected for individual licence holders at intervals during the year and converted via a calibration factor to a volume of water extracted. Water diverted from the river is measured by recording the height at either the gauge or weir with the volume diverted being derived by passing these heights through a rating table. However, with supplementary and uncontrolled flow water being extracted through the same pumps as those extracting water under other categories of access licences additional information is required to separate out supplementary and uncontrolled flow extraction. Basically, licence holders provide notification of their intention to pump prior to pumping or diverting water during the declared supplementary event and provide meter readings both at the commencement and conclusion of pumping. This enables the supplementary flow extraction to be assessed independent of other categories of access licences.

The total volume of supplementary extractions is then calculated by summing the individual extractions and diversions that occurred during declared periods of supplementary flow for the water year.

Methodology (Uncontrolled flow usage)

Uncontrolled flow usage is measured in the same way as general security extractions but is tagged as uncontrolled flow in the accounting system. Under specific rules as outlined in the water sharing plan the uncontrolled usage will be debited against the general security account in a water year.

The summary of these rules is given below:

- Uncontrolled flow can be extracted, up to a limit of 0.85 megalitres per share of entitlement, without debit when the annual allocation plus carryover (effective allocation) is below 0.7 megalitres per share of entitlement.
- When uncontrolled extractions plus effective allocation exceed a volume equivalent to 0.85 megalitres per share of entitlement then the volume of exceedance less any previously debited exceedance water will be debited against the general security allocation account.
- When effective allocation exceeds 0.85 megalitres per share of entitlement then the uncontrolled usage less any previously debited exceedance will be debited against the general security allocation account.

As uncontrolled flow is extracted through the same pumps as those extracting water under other categories of access licences, additional information is required to identify periods and, therefore, volumes of uncontrolled flow extractions. This is achieved by holders providing notification of intent to pump prior to pumping or diverting water during a declared supplementary event and provide meter readings both at the commencement and conclusion of pumping. This enables the uncontrolled flow extraction to be assessed independent of the other categories of access licences.

Additional information

Total supplementary usage and uncontrolled flow usage for reporting period was 542,486 megalitres and 74,772 megalitres respectively. Total supplementary and uncontrolled usage by river section is presented in Figure 56. Total daily supplementary and uncontrolled usage is presented in Figure 57. Uncontrolled usage is presented as accessed as time of extraction. The accounting rules require accessed water to be reclassified as controlled and debited to accounts if allocation triggers are met during the year. Volumes of uncontrolled flow accounted to licences are provided in Table 39.

Figure 56: Supplementary and uncontrolled flow usage by river section

Figure 57: Supplementary water and uncontrolled flow daily usage⁴⁷

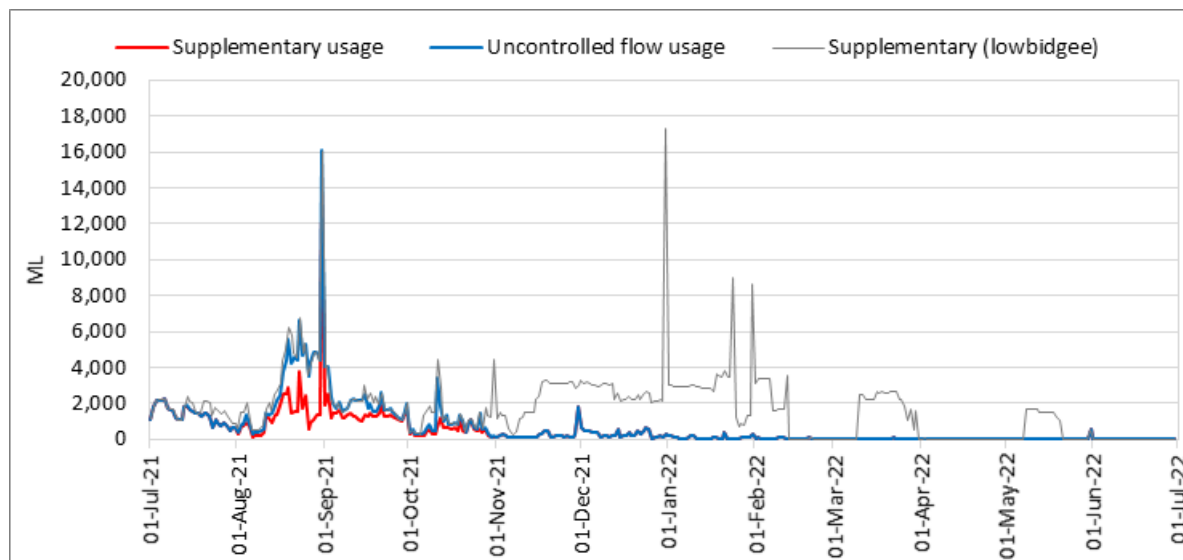

Table 39: Uncontrolled flow allocation accounted usage⁴⁸

Water year	Uncontrolled flow extractions
2004-05	145,197
2005-06	187,302
2006-07	0
2007-08	0
2008-09	0
2009-10	21,977
2010-11	0
2011-12	0
2012-13	0
2013-14	40,547
2014-15	28,014
2015-16	78,931
2016-17	839
2017-18	20,605
2018-19	0
2019-20	16,603
2020-21	7
2021-22	0

⁴⁷ This refers to the total uncontrolled flow usage at the time of extraction i.e. not adjusted for conversion back to general security as per the plan rules.

⁴⁸ This refers to the uncontrolled flow after adjustments for conversions back to general security usage as per the water sharing plan rules.

Note 24 – Unaccounted volume

In theory, if all the processes of a water balance were accurately accounted for the unaccounted difference would be zero. In reality, due to the large accuracy uncertainties in many of the volumes presented in the accounts, the various sources and methods from which the data has been obtained and the fact that not all processes of the water cycle have been accounted for in detail, the statements are not balanced at the end of the accounting process. In order to balance the accounts a final balancing entry is required, and this is termed the unaccounted difference. As technology progresses and accuracy improves in the account estimates, it is anticipated that relatively, this figure should reduce in future accounts.

Data type

Not applicable

Policy

Not applicable

Data accuracy

D – Estimated in the range +/- 100% (this refers to the fact the unaccounted volume is a result of a range of processes estimated using different methodologies and accuracies. The accuracy around the number itself, that is required to achieve mass balances is A1 – Nil accuracy).

Providing agency

Not applicable

Data source

Not applicable

Methodology

The unaccounted difference is equal to the amount required to obtain the correct physical volume in river at the end of the reporting period, after all the known physical inflows and outflows have been accounted. The accounting process of this GPWAR attempted to represent the physical movement of water by creating a river asset. The opening and closing balance of the river volume was estimated according to Note 11.

Surface water unaccounted difference:

$$UV_{sw} = R_s - R_c + R_i - R_o$$

Where:

- UV_{sw} = Unaccounted difference for surface water

- **Rs** = Opening river volume estimate
- **Rc** = Closing river volume estimate
- **Ro** = Physical outflows from the river (e.g. extractions)
- **Ri** = Physical inflows to the river (e.g. runoff, return flows, dam releases)

Note 25 – River and groundwater interaction

This note refers to the net effect of water that has been identified as either flowing from the connected alluvium to the accounted river extent (increase in water asset), and from the accounted river extent to the alluvium aquifer (decrease in water asset).

Data type

Modelled

Policy

Data accuracy

D – Estimated in the range +/- 100%

Providing agency

Department of Planning and Environment

Data source

Department of Planning and Environment MODFLOW (Mid Murrumbidgee), Water Table Fluctuation Model (Lower Murrumbidgee). Data inputs to the models are obtained from HYDSTRA, GDS

Methodology

The river interaction methods used to produce estimates in this GPWAR are documented in the report, *General Purpose Water Accounting Reports: Groundwater methodologies*. This document is available for download from the Department of Planning and Environment webpage.

Method A (Modflow) was used to assess the annual physical groundwater budget in both the Mid Murrumbidgee Groundwater Management Area and the Lower Murrumbidgee groundwater management area. The 2020–21 GPWAR includes results from the recently calibrated Lower Murrumbidgee model which allows separate quantification of both river inflows and river outflows in the accounting statements (a limitation of the method B approach utilised in prior publications resulting where only a net interaction is quantified).

No estimate is included in the statements for any river interactions outside the areas covered by these methods.

Additional information

No annual groundwater budget from Method A is available for the reporting period at the time of reporting.

Note 26 – Snowy River allocation transfer

Through government funded intervention water entitlement is accumulated from the Murrumbidgee (and Murray) valleys, via water saving implementation, or entitlement purchases in order to return water to the Snowy River. The Snowy River has suffered increasing environment degradation, following implementation of the Snowy Mountains Scheme for electricity and irrigation. A significant portion of the rivers historical natural flows were harvested for use west of the Great Dividing Range, and the system no longer received critical high flow events for the ecosystem.

The Snowy Water Inquiry Outcomes Implementation Deed (2002) is a legally binding agreement between the New South Wales, Victoria and Commonwealth governments. The deed includes the water recovery targets for the Snowy, Murray and Snowy Montane Rivers increased flows programs.

Targets for the increased flow programs include returning the following average volumes annually:

- Snowy River (SRIF) – 212,000 megalitres or 21% of the average natural flow
- Murray River (RMIF) – 70,000 megalitres
- Snowy Montane Rivers – up to 117,800 megalitres

Data type

Derived from allocation data

Policy

Snowy Water Inquiry Outcomes Implementation Deed (2002)

Available on the Department of Planning and Environment website at www.industry.nsw.gov.au/water

Data accuracy

A1 – Nil inaccuracy +/- 0%

Providing agency

Department of Planning and Environment

Data source

WaterNSW/ Department of Planning and Environment – Water Accounting System (joint ownership)

Water savings accounting industry.nsw.gov.au/water/basins-catchments/snowy-river/initiative/water-recovery-savings-summary

Methodology

Each year, allocated water in licences acquired by the water for rivers recovery is determined on January 31 (the amount Snowy Hydro is instructed to withhold from upcoming environmental

delivery requirements). A transaction of this amount removes the allocation from the Murrumbidgee licences (decreasing the liability on the Murrumbidgee water assets). Any available water determinations that occur after this date and prior to the closing of the water year, are added to the accounts, with the standard carryover rules of the relative licence category applied.

Additional information

Table 40: Summary of Murrumbidgee water for rivers environmental holdings and transfers in the reporting period

Category	Share	Allocation transferred
Coleambally Irrigation (Conveyance)	3,500	3,500
Murrumbidgee Irrigation (Conveyance)	20,000	20,000
Regulated River (Conveyance)	1,000	1,000
Regulated River (General Security)	75,489	75,489
Regulated River (High Security)	1,885	1,885
Non-licenced water recovery ⁴⁹	N/A	94,809
Total allocation available for release in Snowy River and Murray (RMIF)	-	196,683

⁴⁹ Savings for Forrest Creek replenishment configuration and Computer Aided River Management (CARM) projects are yet to be converted to a registered access licence but are being allowed for in operation.
