## Executive summary

The *Basin Plan 2012* (the Basin Plan) is an adaptive management framework that has been developed by the Murray–Darling Basin Authority (MDBA) to coordinate the management of water resources in the Murray–Darling Basin (MDB). Essential to the Basin Plan is the development of a water resource plan (WRP) for each river valley and groundwater area. A risk assessment is a key step in the development of a WRP for each of these areas in the MDB. One of the risks that must be assessed is the risk of insufficient water for the environment.

Risk assessments require a rating of a *consequence* and the *likelihood* of that consequence occurring, to identify the risk. While all rivers have ecologic value, some have more value than others. The high ecological value aquatic ecosystems (HEVAE) rating of ecological value of rivers was used in rating the consequence of impacting on the ecological function of the rivers. The likelihood of the consequence of impacting on the key ecosystem functions was estimated using hydrologic modelling, and is the subject of this report.

This report documents the assessment method that was used to determine the likelihood of impacting on the key ecosystem functions. The degree of hydrologic alteration of a river's flow will impact of the ecological functioning of the river. The higher the level of hydrologic alteration, the higher the likelihood it is impacting the functioning of the dependant biota. Existing hydrologic models were used, where they were available, to quantify the hydrologic alteration. Where existing models were not available, single-reach models were developed to estimate the degree of hydrologic alteration and subsequently rate the likelihood of impacting on the key ecosystem functions. This report describes the approach used to assess hydrologic alteration, and is a supporting document to the risk assessments completed in each valley.

# 1 Background

The *Basin Plan 2012* (the Basin Plan) is an adaptive management framework that has been developed by the Murray–Darling Basin Authority (MDBA) to provide a coordinated approach to managing water resources across the four member states and territory in the Murray–Darling Basin (MDB).

A risk assessment is a key step in the development of a water resource plan (WRP) for each valley and groundwater area in the MDB. Chapter 4, Part 2 of the Basin Plan (*Risks and strategies to address risks*) sets out matters that must be considered in terms of risk and management strategies in WRPs. Chapter 10, Part 9 (*Approaches to addressing risk to water resources*) outlines how Basin states must undertake risk assessments as well as the MDBA’s associated accreditation requirements. The Basin Plan requires that a WRP must be prepared having regard to current or future risks to the condition and continued availability of water resources of a water resource plan area.

This report documents the assessment method that was used to determine the degree of hydrologic alteration for each water source, in each of the WRP areas. In many cases, hydrologic alteration was used as the basis for the ‘likelihood’ component of the risk assessment (see Figure 1).

**Figure 1. Context of this report with the WRP Risk Assessment**

The Basin Plan, and the work around its implementation, identifies impacts on key ecosystem functions (KEF) of the rivers as an undesirable consequence. One of the objectives of the Basin Plan is to ‘protect and restore the ecosystem functions of water-dependent ecosystems’. The Basin Plan expands on this in its definition of sustainable diversion limits (SDLs). Where part of the definition of the limit is that if exceeded it would compromise ‘key ecosystem functions of the water resource’.

There has been more focus on key environmental assets in implementing the Basin Plan. The risks to the key environmental assets are addressed in the risk assessment by assessing the ecosystem functions that maintain them, as well as the rivers associated with them.

## 1.1 Assessing risk

A risk assessment identifies undesirable consequences and quantifies the likelihood of these consequences occurring. It is the combination of consequence and its likelihood of occurring that quantifies risk (as a risk is the likelihood of a particular consequence). The most common way of presenting the relationship between consequence and its likelihood is in the form of a risk matrix (see Figure 2).

Figure 2. Simple risk matrix

	Low likelihood	Medium likelihood	High likelihood
High consequence	Medium risk	High risk	High
Moderate consequence	Low risk	Medium	High
Low consequence	Low	Low	Medium

## 1.2 Assessing risk in rivers

The majority of unregulated rivers (rivers not declared regulated, as they are not managed with a large dam or water storage supplying water along their length) have their streamflow reduced, most notably through irrigation extractions. A small number of unregulated rivers have dams on them that have the ability to discharge, but these dams generally only capture water, usually resulting in reduced flows downstream. The exceptions, of which there are very few, are dams and schemes that are used for hydroelectricity generation and some town water supply (TWS) schemes that transfer water from one stream to another.

The alteration of streamflow in regulated rivers is quite different to that in the unregulated rivers, as significant volumes are captured or diverted into regulating dams in wet periods, which is later released in dryer periods. While flows can be reduced at the downstream end of regulated rivers, similar to unregulated rivers, this is not always the case. Hydrological alteration in regulated rivers is very variable with the highest degree of alteration often directly downstream of the regulating dam. Alteration such as elevated flows during the irrigation season, reversing the seasonality of flow, the loss of low flow period, as well as the capturing of some high flow events.

The alteration of streamflow in regulated and unregulated rivers can have undesirable consequences, and it is these consequences that the WRP risk assessment is aimed at identifying. The consequence of impacting on a KEF is identified within the WRP risk assessments, and termed ‘consequence’ for the risk evaluation process. Key ecosystem functions are a grouping of ‘physical, chemical and biological exchanges and processes that contribute to the self-maintenance and self-renewal of an ecosystem’ (Alluvium, 2010). The KEFs identified by Alluvium are presented in Table 1.

The degree of consequence was quantified by considering the ecological value of the rivers where key ecosystem functions are being impacted. The approach used for rating the value of rivers is consistent with a nationally recognised framework (*Guidelines for identifying high ecological value aquatic ecosystems—HEVAE*, 2012). The detailed method for applying HEVAE and deriving consequence ratings in NSW is documented in *Applying the high ecological value aquatic ecosystem (HEVAE) framework to water management needs in NSW* (Healey et al, 2018).

To assess the risk to rivers, the likelihood of these consequences occurring is required. It is the purpose of this report to document the modelling used to quantify the likelihood of impact occurring on the key ecosystems functions within unregulated rivers. It is the likelihood information generated from this modelling which is used in the WRP risk assessment.

**Table 1. Identified key ecosystem functions (KEF) (Source: Alluvium, 2010)**

Ecosystem function	Physical process
Disturbance through cease-to-flow periods	Creation and maintenance of bed, bank and riparian habitat
Disturbance and wetting through bankfull and overbank flows	
Provide wetted habitat diversity in pool environments	
Provide wetted habitat diversity in riffle and run environments	
Provide appropriate wetted habitat heterogeneity within a reach (creation of diverse hydraulic features)	
Provide in-channel habitat features within a reach (point bars and benches)	
Organic and inorganic sediment delivery to downstream reaches (debris flows, scouring, flushing of fine sediments)	Mobilisation, of biotic and abiotic material (e.g. sediment, nutrients and organic matter)
Sediment delivery to and from floodplains (floodplains, benches)	
Dilute carbon and nutrients from litter and soil on the floodplain that has been returned to the river systems	
Dispersal of aquatic communities (including drift)	Lateral and longitudinal connectivity to maintain populations
Recolonisation of aquatic fauna and flora communities	
Migration to fulfil requirements of life-history stages (e.g. diadromous fish species)	
Foraging of aquatic species	
Instream primary production by periphyton, phytoplankton and biofilms	

## 1.3 Estimating the likelihood of impacting on key ecosystem functions

The MDBA engaged Alluvium to define key ecosystem functions (KEF) and recommend how to appraise the flow required to maintain them (Alluvium, 2010). This work resulted in the development of a set of flow metrics, which measure flow alteration of particular components of the hydrograph, as well as targets to the amount of alteration that would impact upon the KEF. The KEF hydrologic alteration metrics and limits of alteration are further discussed in Section 5.

The approach taken by Alluvium was consistent with many of the approaches used both in Australia and internationally for evaluating environmental flow requirements of rivers (Alluvium, 2010). While there have been numerous differences in evaluation methods, the approach taken here is consistent with a paper synthesising environmental flow evaluation approaches, titled *Ecological Limits of Hydrologic Alteration (ELOHA)* (Poff, 2010).

The calculation of KEF flow metrics requires two flow sequences: a natural flow sequence used as the reference and an altered flow sequence based on a particular management scenario. To generate these sequences, two types of model were used:

- multi-reach models for major rivers with significant river infrastructure
- single reach river models (or lump models) for smaller river systems.

## 2 Multi-reach modelling

Where possible, existing multi-reach models were used to generate the flow sequences required for calculating the KEF metrics. Multi-reach models have been developed for all regulated river systems. Sequences from these models were used by the MDBA to evaluate the KEF of the regulated rivers. The models that were used for each regulated river are listed in Appendix A.

Multi-reach models were only available for a small number of unregulated rivers. Typically, these models are for streams where there has been substantial investment in water infrastructure such as dams and pipelines (e.g. Fish River and Barwon Darling Rivers). The models that were used for unregulated rivers are presented in Appendix B.

In other locations on unregulated rivers, where the unregulated flows are associated with a regulated river, the sequences from the regulated river multi-reach models could be used. Such locations include:

- unregulated reaches of rivers that are downstream of a regulated system
- terminating effluent streams downstream of a regulated reach
- anabranching effluents on a floodplain associated with the regulated river.

## 3 Single-reach modelling

The simplest configuration of a single-reach model was initially used, which only had an inflow, an irrigator, and an end of system gauge. This was found to be too simplistic for many of the unregulated rivers; therefore a standard, but more complex, model configuration was adopted. This standard configuration was used for virtually all unregulated rivers to:

- automate model development
- improve the ability for others to understand the numerous models
- increase repeatability of the modelling
- maintain the quality of the results.

While the configuration is standardised, the parameterisation of each model is specific to each unregulated river. The node parameters and model assumptions used in the single reach models for each water source are tabulated in Appendix C.

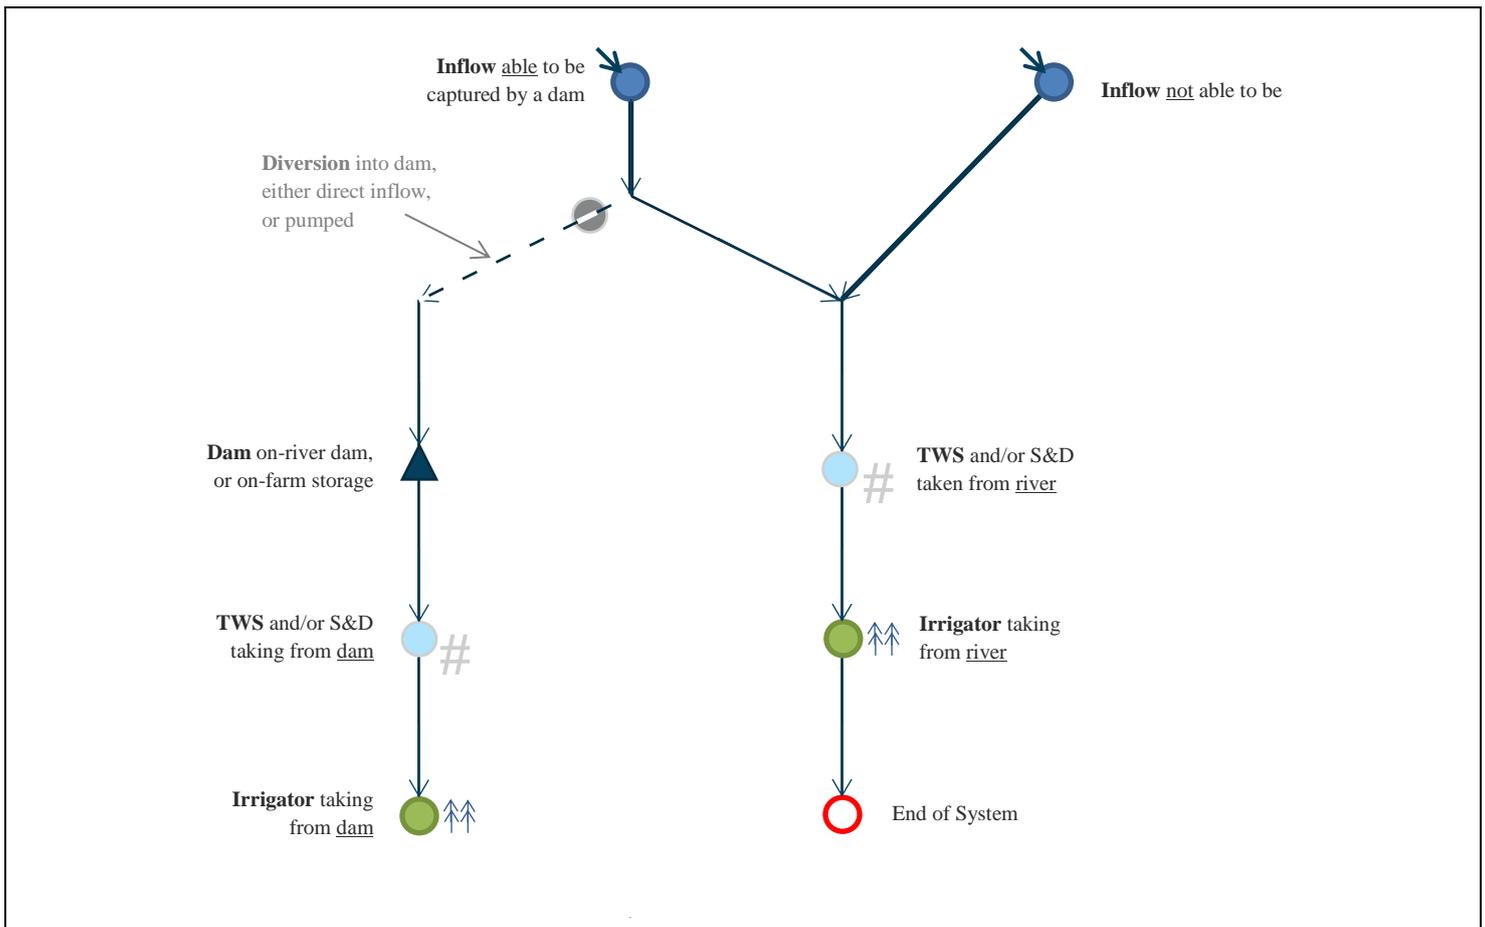

The IQQM modelling package (Version 7.79.10 NSW Office of Water) was used to simulate the unregulated rivers. An MS Excel file was used to generate the system files for each river. The Excel file automated the parameterisation of the standard configuration (from larger datasets), helping maintain the quality of the input data for the numerous models that were developed.

### 3.1 Standard model configuration

The standard model configuration used has two sets of inflows: (1) inflow that can flow into a dam, and (2) inflow that is unimpeded. The model also has two sets of extractors (1) those that can access water from a dam, and, (2) those that access water directly from the river. These function, inflows and extractions, are performed by nodes in the model. Figure 3 illustrates the major nodes of the standard model used for simulation flow and extraction.

The unimpeded flow side of the model (right-hand side of Figure 3) flows to the end of the river system and is the core of the model (further discussion in section 3.1.1). While the flows that can be captured by dams (left-hand side of Figure 3 and highlighted in Figure 5) flow into the uncontrolled flow side if the flow is not captured by the dam (further discussion in section 3.1.2). The full schematic diagram as shown in IQQM is presented in Appendix A.

Figure 3. Standard model configuration used for single reach models

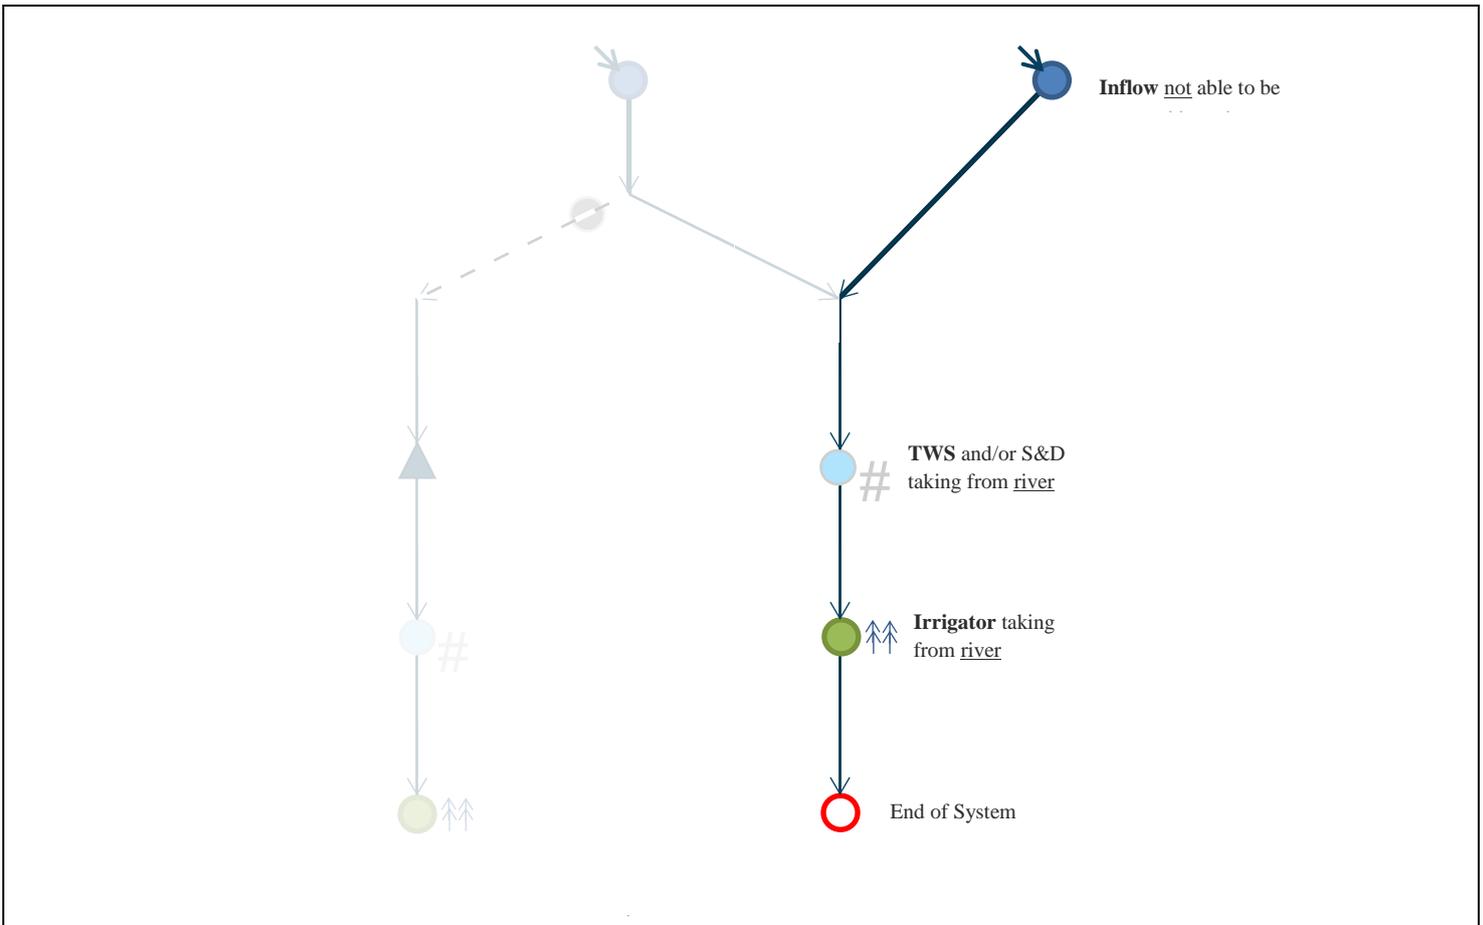

Key: S&D refers to stock and domestic demand and TWS refers to town water demand

### 3.1.1 Run-of-river simulation

If there are no substantial dams in the water source (either on-river dams or on-farm storages), the simplest configuration of a single reach model is used, consisting of an inflow, a TWS extraction, an irrigator, and an end-of-system gauge. These functions are performed by the nodes in the model that are highlighted in Figure 4. The remaining nodes in Figure 4 that would not operate, as there is no dam being simulated, are greyed out. This pattern of extraction is termed ‘run-of-river’ extraction, as water is used directly from the river and is not stored in a dam.

**Figure 4. Standard model configured for unimpeded flow simulation**

### 3.1.2 Stored flow simulation

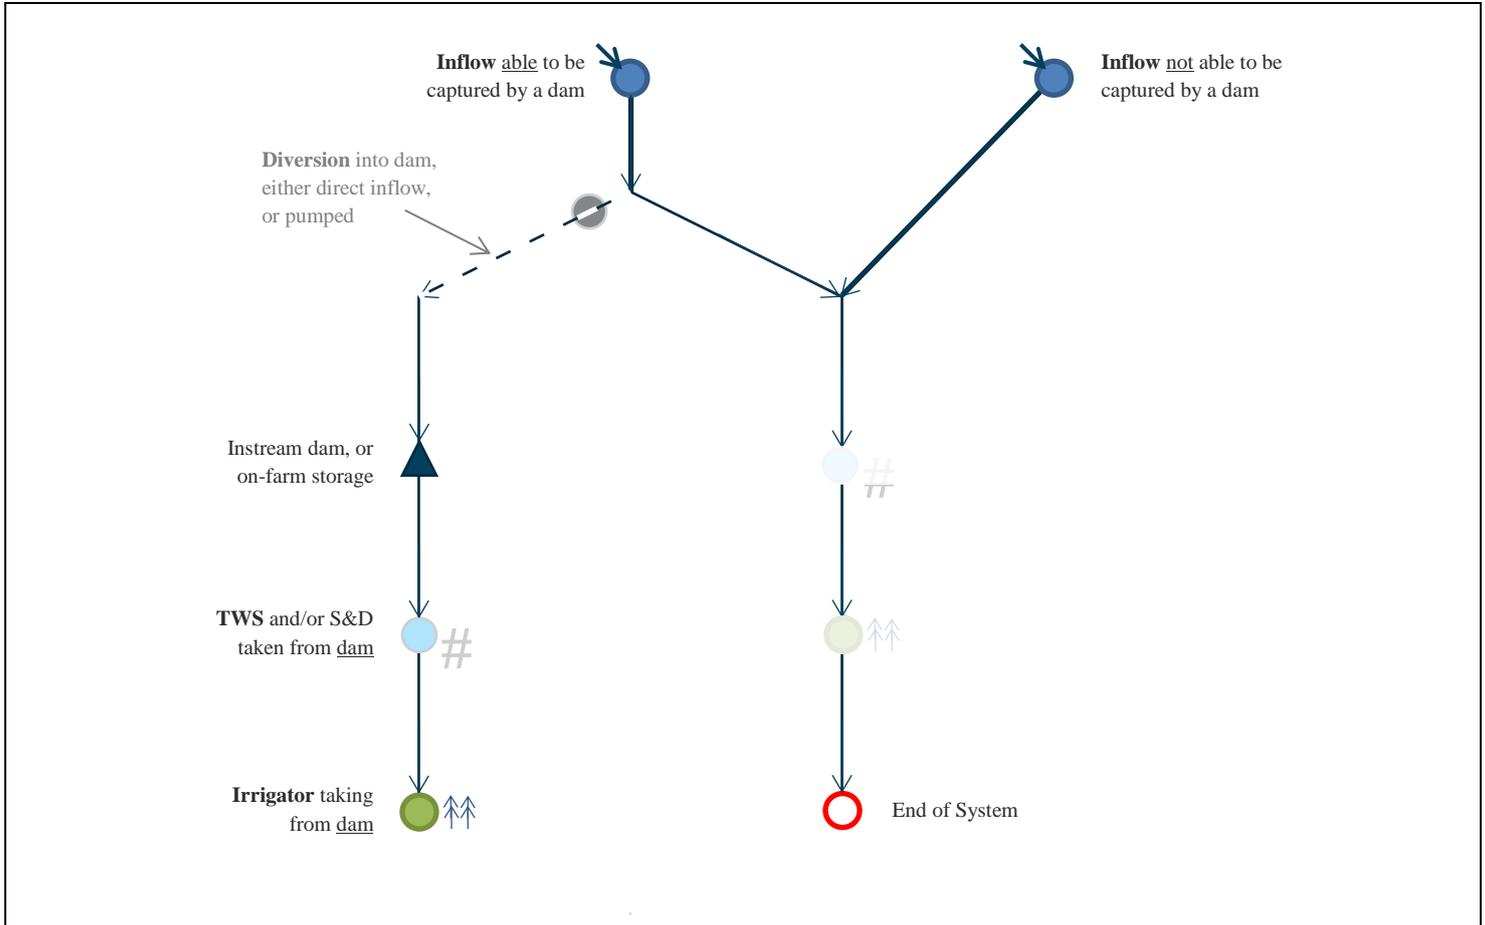

The alternative scenario to run-of-river extraction occurs in streams that do not have consistent flow, hence either utilise on-river dams or on-farm storages. To simulate either of these, the left side of the model can be used. In the extreme case where all water is accessed through a dam or storage, the ‘run-of-river’ extraction nodes are inactive (this is shown by the greyed out nodes in Figure 5).

While on-river dams have to be simulated using the diversion of water into a dam node, there are two possible configurations for simulating the on-farm storage of irrigators (not available for the TWS). The simplest configuration is to add on-farm storage volume into the run of river irrigator node, enabling on-farm storage to be simulated with fewer nodes, as illustrated in Figure 4.

To simulate (1) on-river dams, (2a) the second method of simulating on-farm storage, or (2b) off-river storage for TWS (the equivalent of on-farm storage), the configuration highlighted in Figure 5 would be utilised. For each of these configurations, the nodes that extract water from the dam (the demand nodes below the dam) are set up to order water from the dam. The difference between simulating on-river dams and on-farm storage scenarios using the dam node is how the diversion (dashed line in Figure 5) that runs water into the dam is set

up. If simulating an on-river dam scenario (1), all flow available will be diverted into the dam if it is not full. Alternatively, if simulating an on-farm storage/TWS off-river storage scenario (2a and 2b), the diversion is setup as a pump, with limited pump capacity and a cease-to-pump rule (CtP) if there is one in place.

**Figure 5. Standard model configured for stored flow simulation**

### 3.1.3 Combination simulation

A proportion of the unregulated rivers simulated were essentially run-of-river scenarios where only the run of river extraction nodes were active (see Figure 4). There were also a number that only had extraction from on-farm storage (two methods to simulate available, as in Figure 5; or the alternative using on-farm storage volume in the run of river irrigator node). Some were a combination of different extraction practices; run of river, on-river dams, and/or on-farm storage:

- run of river extraction and on-river dams (in the head water streams)
- run of river extraction and on-farm storage (on the main trunk of the river)
- on-river dams (head water) and on-farm storage (trunk)
- run of river extraction, on-river dams (head water) and on-farm storage (trunk).

The most common combination was combination (a), but the other three combinations were simulated where required.

## 4 Information and data used in the models

While the configuration of the models is consistent, it is the climatic and flow sequences, and parameters quantifying the node operations, which enable the models to represent the different river systems.

## 4.1 Information used for parameters

The adopted standard single-reach IQQM model (see Figure 3) has five types of operational nodes:

1. Inflow node (two used; one for flow available to a dam and one for flow that is not)
2. Diversion node (one used to fill the dam, either as an inflow or pumped)
3. Dam node (one used to simulate either an on-river dam or on-farm storage)
4. TWS and S&D node (two used; one run of river and one that orders from a dam)
5. Irrigator node (two used; one run of river and one that orders from a dam)

The information used to set these nodes up to simulate the movement of water in the unregulated rivers is presented in the following four sections. The information requirements for the dam node and diversion node are presented together in Section 4.1.2.

### 4.1.1 Inflow

While there are two inflow nodes in the models, only one streamflow sequence is used. A proportion of the flow can be entered into the model through each of the two inflow nodes (that is, 50% of the inflow can enter the model through one node and similarly for the other inflow node). The proportion of the inflow that enters the model at each node was determined based on the area that is being simulated by the node (proportional area factoring).

The available flow sequences (See section 4.2.2 for detail on the sequences used) varied in their ability to represent the water available to extractors. In some cases, the flow sequences were derived from a gauging point in the mid-reaches of the river and area factors were used to represent the flow available in the whole river system (that is, a factor greater than one, e.g. 1.45). In other cases, there was no gauging point in the river with adequate data. In this case, a streamflow sequence from an adjacent river (of a similar size, shape and aspect) was used and factored for area.

### 4.1.2 Dam and diversion

The capacity of the dam node was either determined from licensing information (generally only available for TWS dams) or by assumption (assuming that dam capacity is associated with the entitlements, hence it can be estimated as a proportion of the irrigator's entitlement, for example 50%).

Direct rainfall into the dam(s) and evaporation from the dam(s) are estimated by multiplying the water surface area of the dam with either the rainfall or evaporation depth (See Section 4.2.1 for detail on the sourcing of the data). To estimate the dam(s) water surface area, a volume/area relationship is used. This relationship is based on the dam capacity identified and the following assumptions about the shape of the dam(s):

- the dam(s) shape is square
- the depth of the dam(s) (often used an arbitrary depth of 3 m, as this is typical of many dams)
- the number of dams (identified through licensing data).

For some models, the daily evaporation depth from the surface of the dam(s) was estimated by the evapotranspiration sequence to reduce the time to develop the models. Where the dams were significantly large, a more accurate open water evaporation sequence, derived from the class A pan evaporation sequence, was used.

If the dam node was set up to simulate on-river dams, the diversion node was set up to divert all available flow up to the available capacity within the dams. If the dam node was used to simulate on-farm storage, the diversion node was set up as a pump with limited pump capacity and a CtP rule if required.

### 4.1.3 Town water supply and stock and domestic supply

The full development of current licences is used in quantifying risk, as it is anticipated that all entitlements will be active at some time in the future. For the simulation of domestic demands, which includes both town water

supply (TWS) and rural stock and domestic demands (S&D), a constant daily demand is assumed, calculated by dividing the entitlement by 365.

#### 4.1.4 Irrigator

The irrigator nodes include a crop model. This is populated with cropping information collected as part of the conversion of unregulated licences from an area to a volumetric basis, known as the VolCon database (This is a MS Access database of survey results for most *Water Act 1912* licences). The surface authority licences were not entered into this database because their data was too complex, as these were licences with multiple users accessing the water through common infrastructure. Both crop survey data collected and crop water requirement information derived for the conversion of licences was used.

It was assumed that an appropriate crop mix for the future would be similar to the crop mix surveyed between 1993 and 2000. This survey data was retrieved from the VolCon database (MS Access database of survey results). As the survey information was collected for reasonably small sub-catchments (similar to the water sources used in each of the NSW water sharing plans), it was possible to identify the crop mixes for each river.

Full development of current licences is used in quantifying the risk. This was done because there is currently no data available on water usage. Using the full entitlement therefore represents a worst-case scenario. The conversion rates used to convert area licences to volumetric were used in reverse to determine the area of crop that could be irrigated if current entitlement was active.

The crop model in the irrigator node utilises the rainfall and reference crop evapotranspiration sequences 'ETo' (See Section 4.2.1 for detail on the sourcing of the data). To estimate crop demand, another input, the monthly crop factor 'kc' files (values that were generated as part of the licence conversion process) is used (See equation below).

$$\text{Crop demand} = \text{Crop area} \times \text{kc} \times \text{ETo}$$

When the run of river irrigator node was set up to have on-farm storage, the dam capacity, volume/area relationship and the daily evaporation depths were estimated in the same way to that used for the dam node

## 4.2 Time sequence data

Two types of sequences are required for these relatively simple models: climate sequences (which include rainfall, standard evapotranspiration, and open water evaporation) and streamflow sequences that represent the water available to be extracted.

### 4.2.1 Climate data

Climatic data was sourced from the patch point dataset through the SILO website ([www.longpaddock.qld.gov.au/silo/](http://www.longpaddock.qld.gov.au/silo/)). The data is a combination of historic measured, interpolated, and estimated data. The sequences provided for each site start as early as January 1889 and continue up until the day the data is accessed. The text file requested from the site is the *Standard including FAO56 Reference Evapotranspiration (ETo)* format file and has nine sequences.

Generally, only two sequences are obtained: (1) rainfall and (2) reference crop evapotranspiration. An optional sequence of open water evaporation was used in some models, which is derived from the class A pan evaporation sequence.

### 4.2.2 Flow data

Historic streamflow sequences (in ML/day) were used as the inflows to the single-reach models. The duration of the streamflow sequences determined the period of the simulation, as these data sets were shorter than the climate sequence. In most cases, measured streamflow sequences were used, but for some streams a rainfall-runoff modelled sequence was available.

The measured sequences were accessed from the HYDSTRA<sup>1</sup> database and imported into IQQM. Gaps in the sequences, either due to poor quality of the data, or lack of any measurement, were filled. Correlated flow sequences from adjacent unregulated rivers were used to estimate the flow during the missing periods.

The available rainfall-runoff modelled flows were similar in length to the climatic sequences and considerably longer than the measured sequence. The rainfall runoff modelled sequences that were available were used in existing multi-reach models, often as an inflow sequence in a regulated river model.

## 5 Calculating likelihood metrics

The approach of using KEF metrics is consistent with an article that investigated the synthesising environmental flow evaluation approaches used around the world, titled *Ecological Limits of Hydrologic Alteration (ELOHA)* (Poff, 2010). Consequently, using limits to hydrologic alteration (measured by the metrics) to quantify likelihood and evaluate risk is also consistent. Improvement of the application of ELOHA is possible, but at this point in time, the KEF metrics provided a sound basis for assessing the likelihood of flow alteration impacting on riverine ecology.

There were 17 key ecosystem function metrics (KEF metrics) developed by Alluvium (2010) for the MDBA. These metrics cover four critical components of the hydrograph:

- 1) zero flow events
- 2) low flows
- 3) freshes
- 4) bankfull to just overbank flow events.

These metrics are designed to measure the hydrologic alteration of ecologically significant elements of the hydrograph. The zero flow events and the low flow metrics focus on flows below the 80<sup>th</sup> percentile flow (flow exceeded 80% of days). The freshes and bankfull to just overbank flow events metrics focus on flow alteration above the 20<sup>th</sup> percentile flow (flow only exceeded 20% of days). This illustrates that the more extreme components of the hydrograph are particularly significant to ecological processes.

This does not mean that the other parts of the hydrograph are not important. It is important that the moderate flows (60% of days between the 20<sup>th</sup> and the 80<sup>th</sup> percentiles) are maintained at reasonable levels. It can be reasonably argued that the 80<sup>th</sup> percentile would likely be highly altered if moderate flows were, therefore it would most likely only be necessary to consider alteration of moderate flow if the low flow metric was highly altered.

Very infrequent high flows (floods) are also not covered by the KEF metrics. Again, it can be reasonably argued that the just overbank flow events metrics would be highly altered if floods were altered. The size of floods mean that it is hard to alter these events enough to impact of KEF, conversely, it is more likely that low flow and zero flow periods are altered significantly because it is much easier to alter them.

### 5.1 Relating metrics to different stream types

Because the ecology of rivers is not homogeneous, ecosystem functions will have different requirements in different river types. For example, the significance of the frequency and duration of zero flow events in perennial streams is likely to be more significant than in intermittent flowing streams, as the ecology of a perennial flowing stream is not adapted for frequent or long periods of no flow periods.

The KEF metrics are designed to deal with this by being comparative with the base-case hydrology for each stream individually. This is also reflected in preferred KEF targets (or limits to hydrologic alteration) for these metrics, as they are expressed as a percentage change from the base-case hydrology (e.g. 20% increase or

---

<sup>1</sup> HYDSTRA is the database developed by Kisters to store and manage streamflow time series data, as well as other time series data. WaterNSW owns and maintains the main NSW Government HYDSTRA database.

decrease of the size of a flow) and not expressed in absolute terms (e.g. 15ML/day increase or decrease of the size of a flow).

Alluvium investigated separating rivers into different river types to allow the metrics and targets to vary between stream types. For this, they adopted Geomorphic Functional Process Zones. They found that KEFs (presented in Table 1) fell into each of the four hydrograph components in each of the geomorphic zones, with one exception. This is shown in a table, presented in Appendix E where the KEF associated with geomorphic zones is listed. The exception is that a KEF associated with the zero flow component of the hydrograph was not identified for some western streams. The western streams concerned, are more intermittent flowing streams with long duration, zero flow periods.

Other than this exception, all metrics were relevant to all the other river types, although not always for the same functions. There are two reasons that KEF metrics relate so widely: (1) the KEFs are defined as generic ecological process; and (2) the KEF metrics are designed to measure alteration in important components of the hydrology that shape riverine ecology.

## 5.2 Low and high flow seasons

As the climate varies across the basin, much of the water sources have distinct streamflow seasons where flow is lower and higher. To take this into account, a low flow season and high flow season were defined for all of the KEF metrics, with the exception of the bankfull and overbank flow component metrics. The low flow season and high flow season are defined as the five consecutive months with lowest and highest median monthly flow respectively.

In employing this definition, an additional criterion was added: that there is a transition month gap between the low and high flow seasons. This was introduced to be consistent with the metrics published in the MDBA modelling report (MDBA, 2012). It was later found that the transition month gap was not consistently applied in the MDBA modelling report.

## 5.3 Standard metrics

The proposed metrics in the Alluvium report (2010) are in the form of percentage of change, with a reduction seen as a negative percentage and an increase as a positive percentage. This presentation of the metric was adopted. The MDBA modelling report (MDBA 2012) however, presented flow metrics as a ratio, where a decrease was a percentage less than 100% and an increase a percentage greater than 100%.

Separate metrics were calculated for both low flow and high flow seasons for all metrics except the Average Recurrence Interval (ARI) high flow metrics. These are calculated on the full annual sequence.

### Equation 1. Zero flow event component metrics (both low and high flow season)

Percentage change in the Number of years with zero flow events (Zero years)

$$= \frac{(\text{current No. of Zero years}) - (\text{natural No. of Zero years})}{(\text{natural No. of Zero years})} \times 100$$

Percentage change in the Number of zero flow events per year (Zero events/year)

$$= \frac{(\text{current No. of Zero events/year}) - (\text{natural No. of Zero events/year})}{(\text{natural No. of Zero events/year})} \times 100$$

Percentage change in the Average duration of zero flow events (Ave dur of zero events)

$$= \frac{(\text{current Ave dur of zero events}) - (\text{natural Ave dur of zero events})}{(\text{natural Ave dur of zero events})} \times 100$$

(natural Ave dur of zero events)

**Equation 2. Low flow (baseflow) component metrics** (both low and high flow season)

Percentage change in the size of the 80<sup>th</sup> percentile flow (80<sup>th</sup> percentile flow)

$$= \frac{(\text{current } 80^{\text{th}} \text{ \%ile flow}) - (\text{natural } 80^{\text{th}} \text{ \%ile flow})}{(\text{natural } 80^{\text{th}} \text{ \%ile flow})} \times 100$$

**Equation 3. Fresh event (spate) component metrics** (both low and high flow season)

Percentage change in the Number of years with freshes (Fresh years)

$$= \frac{(\text{current No. of Fresh years}) - (\text{natural No. of Fresh years})}{(\text{natural No. of Fresh years})} \times 100$$

Percentage change in the Number of freshes per year (Fresh events/year)

$$= \frac{(\text{current No. of Fresh events/year}) - (\text{natural No. of Fresh events/year})}{(\text{natural No. of Fresh events/year})} \times 100$$

Percentage change in the Average duration of freshes (Ave dur of fresh events)

$$= \frac{(\text{current Ave dur of fresh events}) - (\text{natural Ave dur of fresh events})}{(\text{natural Ave dur of fresh\_events})} \times 100$$

**Equation 4. Bankfull to overbank flow events component metrics** (all year)

Percentage change in the 1.5 year ARI flow, 2.5 year ARI flow, 5 year ARI flow (X year ARI flow)

$$= \frac{(\text{current X year ARI flow}) - (\text{natural X year ARI flow})}{(\text{natural X year ARI flow})} \times 100$$

## 5.4 Corrected metrics for event loss and join

The metrics for flow event (zero flow events and freshes) can be confusing in some cases, as they can show a change in the metric which conflicts with what is happening to flow. In virtually all unregulated rivers, this can be rectified because flow can only be reduced, not increased, as can occur in regulated rivers. Three corrections were made to the metrics for unregulated rivers to avoid counter intuitive values.

## Zero flow event component metrics

**Correction 1:** In calculating the number of zero flow events, the number of events can reduce, even though the number of days with zero flow has increased. This is because extraction can reduce flow between zero flow events joining them together, hence reducing the number of events.

To avoid the change in zero flow events per year metric showing a decrease when zero flows are increasing, events that were joined together were still considered as separate events. For example, if three events that had flows between them were joined into one through extraction, the event would be counted as three events when calculating this frequency metric.

**Correction 2:** In calculating the average duration of zero flow events, the duration of events can reduce, even though the number of days with zero flow has increased. This is because extraction can create a number of short zero flow events, hence reducing the average duration of events.

To avoid the change in average duration of zero flow events metric showing a decrease when zero flows are increasing, the number of events was held static. This ignores both joined events (which increase the duration metric) as well as the created low flow periods (often reducing the duration metric). For example, if a short event was created through extraction, it was assumed to be joined to the existing events when calculating this average duration metric.

## Fresh event (spate) component metrics

**Correction 3:** In calculating the average duration of fresh events, the average duration of events can increase, even though the number of days with higher flow has decreased. This is because extraction can remove smaller, shorter fresh events, hence increasing the average duration of events.

To avoid the change in average duration of fresh events metric showing an increase when freshes are decreasing, only the duration of events that remain after extraction was considered. This ignores the duration of events that were lost all together. For example, if a fresh event was lost through extraction, it was not included in calculating this average duration metric.

# 6 Applying the likelihood metrics

The metrics presented in the previous section are measures of hydrologic alteration and indicators of the likelihood of impacting on ecosystem functions, as the higher the alteration of flows, the high the likelihood that the ecosystem functions are being impacted. These metrics indicated the alteration in the four different parts of the hydrograph (zero flow, low flow, freshes, and bankfull to overbank flows). In the three lower flow metrics, both low and high flow seasons metrics are calculated. The exception is the higher flows, where the bankfull and overbank flow component are calculated as annual metrics.

The metrics for the zero flow and low flow components in the unregulated rivers generally show the greatest alteration during the dryer, low flow season. For the fresh component, the season most altered varied, depending on the hydrology of the stream and the predominant extraction practice used in the area; run of river, or pumping to storage. Overbank flow metrics often showed no impact in run of river unregulated systems. In unregulated rivers where there was high flow extraction, the lower flow 1.5-year ARI metric generally showed the greatest alteration and the 5-year ARI metric the least.

The metrics in the regulated rivers are much more varied and are dependant of the location within the regulated river system. In the upper reaches directly below a dam, the low flow metrics often showed increase in the flow due to irrigation deliveries, sometimes making the dryer season wetter, and the wetter season dryer. In these upper reaches, the higher flows were generally reduced due to the flows impounded by the dam, while lower in the system the higher flows could have less impact, as tributaries entering the system can provide some high flow variability. The pattern of hydrologic alteration is much more complicated in the regulated rivers in comparison to the unregulated rivers due to the size and configuration of the infrastructure that regulates the flows.

An example of the 17 KEF metrics is presented in Table 2. In the first column of the table you can see the 'number of years with cease to flow in the low flow season' has been reduced by 100%, and in the far right column the 'change in the 5-year Average Reoccurrence Interval (ARI) flow' has reduced by 21%.

**Table 2. KEF metrics for an example stream**

Zero Flow Periods						Baseflow or Low Flows		Fresh Flows						Bankfull and Overbank Flows		
Low flow season			High flow season			Low	High	Low flow season			High flow season			All year		
N <sup>o</sup> yrs with CtF	Ave CtF per year	Ave Dur CtF	N <sup>o</sup> yrs with CtF	Ave CtF per year	Ave Dur CtF	Chge in 80 <sup>th</sup> %ile	Chge in 80 <sup>th</sup> %ile	N <sup>o</sup> yrs with Fresh	Ave Fresh per year	Ave Dur Fresh	N <sup>o</sup> yrs with Fresh	Ave Fresh per year	Ave Dur Fresh	Chge in 1.5yr ARI	Chge in 2.5yr ARI	Chge in 5yr ARI
-100%	-100%	-100%	-100%	-100%	-100%	15%	-1%	-35%	-45%	-2%	-21%	-36%	-17%	-36%	-30%	-21%

Abbreviations:

- N<sup>o</sup> = number
- yrs = years
- CtF = cease to flow events
- Ave = average
- Dur = duration,
- Chge = change
- %ile = percentile
- ARI = average reoccurrence interval.

Intrinsic to evaluating risk is estimating the likelihood of a defined consequence. In this assessment, it was the consequence of impacting on the KEFs being assessed. The consequence of impairing riverine KEFs was rated as either high, medium, or low, based on the HEVAE assessment of river value. Further detail is available in the HEVAE method documentation (Healey et al, 2018). This was a value decision indicating that altered hydrology, impacting on the functioning of the ecology, in some rivers is more significant than in other rivers. It was assumed in defining consequence that it is the same for each of the four hydrologic components, as KEF were identified in most stream types (see Section 5.1).

The consequence of impairing ecosystem function in different seasons, low or high, was not captured in the defining consequence as the consequences were not seasonal. Seasonal likelihood measures, while providing more information, were not necessary for evaluating risk, hence only a single indicator of likelihood of impacts on each of the three components (zero flow, low flow, and fresh hydrograph components) were needed. The metrics for these were rolled up into one metric by selecting the highest impacted (furthest from 0%) for each flow component. An example of the rolled up metrics is shown in Table 3.

**Table 3. Rolled up metrics for an example stream**

Zero Flow Periods	Baseflow or Low Flows	Fresh Flows	Bankfull and Overbank Flows		
			1.5 ARI	2.5 ARI	5.0 ARI
-100%	15%	-45%	-36%	-30%	-21%

Likelihood category definitions are defined based on the extent of deviation from the near-natural condition (Table 4). Flow deviation can be positive (for example, 25%), which means more water is available for that particular flow component than the near-natural condition; conversely a negative deviation (for example –25%) means less water for that particular flow component. Note this is a different style of presenting the same metrics that the MDBA have published, as they presented them as a ratio, where an increase is represented as above 100% (e.g. 125%), and reduction is below 100% (e.g. 75%).

**Table 4. Likelihood metrics for risk of insufficient water available for the environment**

Likelihood metric	Metric category	Metric category definition
Flow Deviation of scenario compared to near-natural condition	Low	< 20% departure from near-natural condition (+/-)
	Medium	20-50% departure from near-natural condition (+/-)
	High	> 50% departure from near-natural condition (+/-)
Reference: Alluvium 2010; VanLaarhoven & van der Wielen 2009		

Based on the ranges of hydrologic alteration indicated in Table 4, the metrics are converted to likelihood ratings of high, medium, and low. An example of the rating of likelihood is in Table 5.

**Table 5. Likelihood rating for an example stream**

Zero Flow Periods	Baseflow or Low Flows	Fresh Flows	Bankfull and Overbank Flows		
			1.5 ARI	2.5 ARI	5.0 ARI
H-	L+*	M-	M-	M-	M-

As indicated in the Background section of the report, the likelihood ratings are used in conjunction with the consequence rating to determine a risk rating. The details on how these likelihood ratings are used to determine risk rating is presented in the Risk Assessments for the surface water in the Water Resource Planning Areas (presented in the ‘Risks to water available for the environment and capacity to meet environmental water requirements’ sections of the risk assessments reports).

## 7 Improvements

The length of flow records used in some models was short and could be extended using rainfall runoff modelling. Ideally, all models would use the same period of record, possibly extending out to nearly 100 years in duration.

If possible, the flow sequences would represent naturalised flow sequences, where the extractions that have reduced the measured flow sequences are added back into the flow sequence. Consideration of whether this is repetitive of the flow that is available to extract could also see some other adjustment either up or down.

While the crop mix information is reasonable, there are other types of farm information which would improve modelling, such as the typical amount of on-farm storage in the different river systems and the typical pump capacities, both into storage and onto crops. In many cases, the unregulated water that is extracted is only to supplement other sources of water; groundwater, floodplain harvested water, supplementary water, and regulated water from the regulated river system. Understanding more about how these other sources are used would also improve the simulation of unregulated water extraction.

Should more specific ecological functions be identified in the future, the need to identify and separate river types would likely be required. Using river types would be consistent with the ELOHA process and could be

generated using the ANAE guidelines (AETG, 2012a). Currently 10 geomorphic types have been proposed for NSW rivers. These are based on grouping River Styles® (Brierley & Fryirs, 2005) that have been mapped across all of NSW. To better employ the approach suggested within ELOHA and meet the ANAE guidelines, hydrologic types would need to be overlaid with the geomorphic types to generate adequate river typing, and allow more specific ecosystem functions to be considered.

More sophisticated KEF metrics for use in regulated rivers could be investigated. The metrics for analysing events (both zero flow events and fresh event metrics) often appear contrary to reality and are misleading if considered separately from the other metrics. Such metrics would need to consider whether events are being joined, being removed, or being created. This is because the average event frequency metrics and the average event duration metrics can suggest more flow when there is less and vice-versa. This is because averaging the duration misses information about change in frequency. Similarly, averaging frequency misses information about changes in duration. Ideally, more sophisticated KEF metrics would be able to be applied constantly no matter how the hydrology is altered, and the metric could be intuitive, even when evaluated without the context of the other metrics (also see discussion in Section 5.4).

Table 10. Glen Innes

<b>Water source and model</b>	<b>Glen Innes: model Severn River</b>	
<b>Water source boundaries</b>	The main stream is the Severn River with headwater streams flowing into it. Part of the lower end of the water source has some small residual streams flowing into the regulated river dam. The Severn River flows into Pindari Dam, which falls in the lower end of the water source.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station "Severn River at Strathbogie" (416039).</p> <p>The flow sequence extends from 10/05/1974 to 05/11/2009, 35.5 years in total. 1.7% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.10.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (14% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 5764 ML made up of:</p> <ul style="list-style-type: none"> <li>• 4599 ML Unregulated category entitlement</li> <li>• 1165 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 76.65 ML/day was available for irrigation and 3.19 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>1000 ML of on-river dam capacity was simulated.</p> <p>0% of the unregulated entitlement had access to on-river dams.</p> <p>97% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Glen Innes: model Severn River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Glen Innes” (416_15) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 10%</li> <li>• Perennial pasture 7%</li> <li>• Summer Maize 67%</li> <li>• Vegetables 2%</li> <li>• Wheat 14%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Severn River system was estimated to be 1,387 ha.</p> <p>The weather station used was Deepwater Post Office (station number 56008).</p> <p>The crop factor file used was “nhtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions identified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 11. Inverell

<b>Water source and model</b>	<b>Inverell: model Macintyre River</b>	
<b>Water source boundaries</b>	The main stream is the Macintyre River with headwater streams flowing into it. Part of the lower end of the water source has some small residual streams flowing into the trunk stream.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Macintyre River at Wallangra” (416010).</p> <p>The flow sequence extends from 01/01/1937 to 19/11/2009, 72.9 years in total. 1.5% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.07.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (29% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 7,377.5 ML made up of:</p> <ul style="list-style-type: none"> <li>• 7,206 ML Unregulated category entitlement</li> <li>• 71.5 ML Domestic and Stock category</li> <li>• 100 ML LWU category entitlement</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 120.10 ML/day was available for irrigation and 0.47 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>100 ML of on-river dam capacity was simulated. 0% of the unregulated entitlement had access to on-river dams.</p> <p>58% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Inverell: model Macintyre River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Inverell” (416_14) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 4%</li> <li>• Lucerne 67%</li> <li>• Perennial pasture 10%</li> <li>• Intensive perennial pasture 4%</li> <li>• Soybeans 2%</li> <li>• Summer Maize 6%</li> <li>• Vegetables 1%</li> <li>• Wheat 6%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Macintyre River system was estimated to be 1,190 ha.</p> <p>The weather station used was Inverell Comparison (station number 56017).</p> <p>The crop factor file used was “nthtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions identified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 12. Kings Plains

<b>Water source and model</b>	<b>Kings Plains: model Frazers Creek</b>	
<b>Water source boundaries</b>	The main stream is Frazers Creek with headwater streams flowing into it. Part of the lower end of the water source has some small residual streams flowing into the trunk stream.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Frazers Creek at Westholme (Ashford)” (416021).</p> <p>The flow sequence extends from 07/03/1967 to 15/04/2015, 48.1 years in total. 28.3% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.04.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 564 ML made up of:</p> <ul style="list-style-type: none"> <li>• 559.5 ML Unregulated category entitlement</li> <li>• 4.5 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 9.33 ML/day was available for irrigation and 0.01 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

Table 13. Mole River

<b>Water source and model</b>	<b>Mole River: model Mole River</b>
<b>Water source boundaries</b>	The main stream is the Mole River with headwater streams flowing into it.
<b>Assumptions</b>	<b>Confidence</b>
<b>Flow sequence</b>	High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Mole River at Donaldson” (416032).</p> <p>The flow sequence extends from 01/02/1924 to 16/11/2009, 85.8 years in total. 0.1% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>
<b>total area factor</b>	The flow sequence was factored for area by 1.03.
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (14% of the unfactored flow sequence) is able to be captured by on-river dams.
<b>on-farm dams area factor</b>	No on-farm dams simulated.
<b>Water access</b>	Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 4,867 ML made up of:</p> <ul style="list-style-type: none"> <li>• 4,766.5 ML Unregulated category entitlement</li> <li>• 36.5 ML Domestic and Stock category</li> <li>• 64 ML LWU category entitlement</li> </ul>
<b>access rules (CtP)</b>	A CtP was not simulated.
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.
<b>pump capacity</b>	A pump capacity of 79.44 ML/day was available for irrigation and 0.28 ML/day was available for Stock and Domestic and LWU water extraction.
<b>on-river dam access</b>	<p>130 ML of on-river dam capacity was simulated. 4% of the unregulated entitlement had access to on-river dams.</p> <p>64% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>
<b>on-farm storage available</b>	No on-farm storage simulated.
<b>Irrigation pattern</b>	High

<b>Water source and model</b>	<b>Mole River: model Mole River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit "Tenterfield Creek2 (half)" (416_21) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 2%</li> <li>• Lucerne 43%</li> <li>• Orchard 6%</li> <li>• Perennial pasture 13%</li> <li>• Summer Maize 12%</li> <li>• Vegetables 18%</li> <li>• Wheat 6%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Mole River system was estimated to be 867 ha.</p> <p>The weather station used was Mole River (Trenayr) (station number 56055).</p> <p>The crop factor file used was "nthtab6ed.crp", which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 14. Ottleys Creek

<b>Water source and model</b>	<b>Ottleys Creek: model Ottleys Creek</b>	
<b>Water source boundaries</b>	The main stream is Ottleys Creek with headwater streams flowing into it. Part of the lower end of the water source has some small residual streams flowing into the trunk stream.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station "Ottleys Creek at Coolatai" (416020).</p> <p>The flow sequence extends from 03/03/1967 to 14/12/2009, 42.8 years in total. 0.9% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 3.66. Of this factor 266 was not available to be accessed by licence holders.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 101 ML made up of:</p> <ul style="list-style-type: none"> <li>• 101 ML Unregulated category entitlement</li> <li>• 0 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 1.68 ML/day was available for irrigation and 0.00 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Moderate

<b>Water source and model</b>	<b>Ottleys Creek: model Ottleys Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Dumaresq” (416_07) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Fababean 32%</li> <li>• Lucerne 37%</li> <li>• Wheat 32%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Ottleys Creek system was estimated to be 20 ha.</p> <p>The weather station used was Coolatai (Orana) (station number 54012).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>Alluvial groundwater is accessed in the vicinity of these unregulated streams which may also impact on streamflow but these were not simulated.</p>
<b>Licence locations</b>	

Table 15. Reedy Creek

<b>Water source and model</b>	<b>Reedy Creek: model Reedy Creek (along with other small streams)</b>	
<b>Water source boundaries</b>	The main stream is Reedy Creek (along with other small streams), which flow into the regulated river.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Reedy Creek at Dumaresq” (416026).</p> <p>The flow sequence extends from 24/04/1969 to 31/12/1988, 19.7 years in total. 28.6% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		NA
<b>level of entitlement</b>	The total entitlement simulated was OML made up of:	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 0.00 ML/day was available for irrigation and 0.00 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Moderate

<b>Water source and model</b>	<b>Reedy Creek: model Reedy Creek (along with other small streams)</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Bonshaw (small part)” (416_12) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 56%</li> <li>• Vegetables 33%</li> <li>• Grapes 11%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Reedy Creek (along with other small streams) system was estimated to be 0ha.</p> <p>The weather station used was Bonshaw (Monkstadt) (station number 56041).</p> <p>The crop factor file used was “nthtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.

<b>Licence locations</b>	

## Gwydir unregulated river models

Table 18. Boorolong Creek

<b>Water source and model</b>	<b>Boorolong Creek: model Boorolong Creek</b>	
<b>Water source boundaries</b>	The main stream is Boorolong Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Boorolong Creek at Yarrowyck” (418020).</p> <p>The flow sequence extends from 01/06/1965 to 14/09/1987, 22.3 years in total. 0.6% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (90% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 231 ML made up of:</p> <ul style="list-style-type: none"> <li>• 225 ML Unregulated category entitlement</li> <li>• 6 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 3.75 ML/day was available for irrigation and 0.02 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>115 ML of on-river dam capacity was simulated. 100% of the unregulated entitlement had access to on-river dams.</p> <p>50% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Boorolong Creek: model Boorolong Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Boorolong Creek” (418_30) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 34%</li> <li>• Perennial pasture 66%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Boorolong Creek system was estimated to be 42 ha.</p> <p>The weather station used was Guyra Post Office (station number 56016).</p> <p>The crop factor file used was “nthtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 19. Rocky River

<b>Water source and model</b>	<b>Rocky River: model Rocky River</b>	
<b>Water source boundaries</b>	The main stream is the Rocky River downstream of other water sources that flow into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Gwydir River at Yarrowyck” (418014).</p> <p>The flow sequence extends from 01/01/1955 to 10/05/2009, 54.4 years in total. 0.6% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (35% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Low
<b>level of entitlement</b>	<p>The total entitlement simulated was 893.5ML made up of:</p> <ul style="list-style-type: none"> <li>• 253 ML Unregulated category entitlement</li> <li>• 640.5 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 4.22 ML/day was available for irrigation and 1.75 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>400 ML of on-river dam capacity was simulated. 100% of the unregulated entitlement had access to on-river dams.</p> <p>97% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Rocky River: model Rocky River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Rocky River” (418_28) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 100%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Rocky River system was estimated to be 51ha.</p> <p>The weather station used was Uralla (Dumaresq St) (station number 56034).</p> <p>The crop factor file used was “nthtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 20. Roumalla Creek

<b>Water source and model</b>	<b>Roumalla Creek: model Roumalla Creek</b>	
<b>Water source boundaries</b>	The main stream is Roumalla Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station "Roumalla Creek at Kingstown" (418024).</p> <p>The flow sequence extends from 10/06/1965 to 15/01/1989, 23.6 years in total. 3.4% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.10.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (1% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 254 ML made up of:</p> <ul style="list-style-type: none"> <li>• 242 ML Unregulated category entitlement</li> <li>• 12 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 4.03 ML/day was available for irrigation and 0.03 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>30 ML of on-river dam capacity was simulated. 25% of the unregulated entitlement had access to on-river dams.</p> <p>42% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Roumalla Creek: model Roumalla Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Roumalla Creek” (418_01) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 88%</li> <li>• Perennial pasture 12%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Roumalla Creek system was estimated to be 48ha.</p> <p>The weather station used was Uralla (Dumaresq St) (station number 56034).</p> <p>The crop factor file used was “nthtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 21. Upper Gwydir River

<b>Water source and model</b>	<b>Upper Gwydir River: model Gwydir River</b>	
<b>Water source boundaries</b>	The main stream is the Gwydir River downstream of other water sources that flow into it. The reach of Gwydir River in this water sources may be better managed as a separate water sources (linear) along with other reaches of the Gwydir River. Similarly for associated residual tributaries in a separate (polygon) water source.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on the gauging station "Gwydir River at Stonybatter" (418029).  The flow sequence extends from 01/01/1889 to 06/07/2009, 120.5 years in total.	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (7% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Low
<b>level of entitlement</b>	The total entitlement simulated was 2,486 ML made up of: <ul style="list-style-type: none"> <li>• 1,806 ML Unregulated category entitlement</li> <li>• 680 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 30.10 ML/day was available for irrigation and 1.86 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	875 ML of on-river dam capacity was simulated. 55% of the unregulated entitlement had access to on-river dams. 91% of the Stock and Domestic and LWU entitlement had access to the on-river dams.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Moderate

<b>Water source and model</b>	<b>Upper Gwydir River: model Gwydir River</b>

## Namoi unregulated river models

Table 45. Upper Macdonald River

<b>Water source and model</b>	<b>Upper Macdonald River: model Macdonald River</b>
<b>Water source boundaries</b>	The main stream is the Macdonald River with headwater streams flowing into it.
<b>Assumptions</b>	<b>Confidence</b>
<b>Flow sequence</b>	High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Macdonald River at Cobrabald” (419038).</p> <p>The flow sequence extends from 22/06/1965 to 12/04/1987, 21.8 years in total. There was no need to fill any gaps in the measured flow sequence.</p>
<b>total area factor</b>	The flow sequence was factored for area by 1.97.
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (9% of the unfactored flow sequence) is able to be captured by on-river dams.
<b>on-farm dams area factor</b>	No on-farm dams simulated.
<b>Water access</b>	High
<b>level of entitlement</b>	<p>The total entitlement simulated was 30 ML made up of:</p> <ul style="list-style-type: none"> <li>• 30 ML Unregulated category entitlement.</li> </ul>
<b>access rules (CtP)</b>	A CtP was not simulated.
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.
<b>pump capacity</b>	A pump capacity of 0.50 ML/day was available for irrigation and 0.00 ML/day was available for Stock and Domestic and LWU water extraction.
<b>on-river dam access</b>	<p>3 ML of on-river dam capacity was simulated.</p> <p>100% of the unregulated entitlement had access to on-river dams.</p> <p>0% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>
<b>on-farm storage available</b>	No on-farm storage simulated.
<b>Irrigation pattern</b>	High

<b>Water source and model</b>	<b>Upper Macdonald River: model Macdonald River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Upper Macdonald River” (419_41) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 100%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Macdonald River system was estimated to be 6 ha.</p> <p>The weather station used was Walcha Post Office (station number 56035).</p> <p>The crop factor file used was “nthtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 46. Mid-Macdonald River

<b>Water source and model</b>	<b>Mid-Macdonald River: model Macdonald River</b>
<b>Water source boundaries</b>	The main stream is the Macdonald River downstream of other water sources that flow into it.
<b>Assumptions</b>	<b>Confidence</b>
<b>Flow sequence</b>	Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Macdonald River at Retreat” (419028).</p> <p>The flow sequence extends from 07/09/1965 to 24/02/1987, 21.5 years in total. 1.4% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>
<b>total area factor</b>	The flow sequence was factored for area by 1.00.
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (1% of the unfactored flow sequence) is able to be captured by on-river dams.
<b>on-farm dams area factor</b>	No on-farm dams simulated.
<b>Water access</b>	Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 4,485.5 ML made up of:</p> <ul style="list-style-type: none"> <li>• 4,350 ML Unregulated category entitlement</li> <li>• 135.5 ML Domestic and Stock category.</li> </ul>
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 10 ML/day, which simulated a CtP at the end of the system.
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.
<b>pump capacity</b>	A pump capacity of 73.00 ML/day was available for irrigation and 0.37 ML/day was available for Stock and Domestic and LWU water extraction.
<b>on-river dam access</b>	<p>400 ML of on-river dam capacity was simulated.</p> <p>13% of the unregulated entitlement had access to on-river dams.</p> <p>9% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>
<b>on-farm storage available</b>	No on-farm storage simulated.
<b>Irrigation pattern</b>	High

<b>Water source and model</b>	<b>Mid-Macdonald River: model Macdonald River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Mid Macdonald River” (419_19) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 3%</li> <li>• Perennial pasture 97%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Macdonald River system was estimated to be 736 ha.</p> <p>The weather station used was Bendemeer (Caroline St) (station number 55004).</p> <p>The crop factor file used was “nthtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions identified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.</p> <p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 47. Upper Namoi: model Namoi River

<b>Water source and model</b>	<b>Upper Namoi: model Namoi River</b>	
<b>Water source boundaries</b>	The main stream is the Namoi River downstream of other water sources that flow into it.	
<b>Assumptions</b>	<b>Confidence</b>	
<b>Flow sequence</b>	Moderate	
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Halls Creek at Ukolan and Namoi River at North Cuerindi” (419029 and 419005).</p> <p>The flow sequence extends from 22/05/1965 to 27/07/2008, 43.2 years in total. 4.8% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.05.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (105% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>	Moderate	
<b>level of entitlement</b>	<p>The total entitlement simulated was 15,814 ML made up of:</p> <ul style="list-style-type: none"> <li>• 14,911 ML Unregulated category entitlement</li> <li>• 183 ML Domestic and Stock category</li> <li>• 720 ML LWU category entitlement.</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 0.1 ML/day, which simulated a CtP at the end of the system.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 248.52 ML/day was available for irrigation and 2.47 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>2 ML of on-river dam capacity was simulated.</p> <p>0% of the unregulated entitlement had access to on-river dams.</p> <p>80% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.

This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 2%</li> <li>• Fababean 2%</li> <li>• Lucerne 70%</li> <li>• Perennial pasture 11%</li> <li>• Summer Maize 2%</li> <li>• Wheat 13%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Halls Creek system was estimated to be 160ha.</p> <p>The weather station used was Manilla Post Office (station number 55031).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.</p>

Table 49. Upper Manilla

<b>Water source and model</b>	<b>Upper Manilla: model Manilla River (not Ironbark Creek)</b>	
<b>Water source boundaries</b>	The main streams are Manilla River and Ironbark Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on the gauging station “Manilla River at Black Springs” (419053).</p> <p>The flow sequence extends from 01/01/1890 to 31/12/1996, 107.0 years in total.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,690 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,668 ML Unregulated category entitlement</li> <li>• 22 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 3 ML/day, which simulated a CtP at the end of the system.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 27.80 ML/day was available for irrigation and 0.06 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Upper Manilla: model Manilla River (not Ironbark Creek)</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Upper Manilla” (419_32) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 3%</li> <li>• Lucerne 83%</li> <li>• Perennial pasture 4%</li> <li>• Summer Maize 1%</li> <li>• Vegetables 1%</li> <li>• Wheat 8%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Manilla River (not Ironbark Creek) system was estimated to be 271 ha.</p> <p>The weather station used was Barraba Post Office (station number 54003).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.

Table 50. Keepit

<b>Water source and model</b>	<b>Keepit: model Lake Keepit</b>	
<b>Water source boundaries</b>	The main waterbody is Lake Keepit, which is part of the Regulated System, and it is the small stream that flow into it that make up the unregulated water source.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station "Halls Creek at Ukolan" (419029).</p> <p>The flow sequence extends from 22/05/1965 to 27/07/2008, 43.2 years in total. 4.8% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.24.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (22% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 774 ML made up of:</p> <ul style="list-style-type: none"> <li>• 769 ML Unregulated category entitlement</li> <li>• 5 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 12.82 ML/day was available for irrigation and 0.01 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>300 ML of on-river dam capacity was simulated. 42% of the unregulated entitlement had access to on-river dams.</p> <p>0% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Keepit: model Lake Keepit</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Keepit” (419_21) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 3%</li> <li>• Lucerne 67%</li> <li>• Perennial pasture 14%</li> <li>• Wheat 16%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Lake Keepit system was estimated to be 132ha.</p> <p>The weather station used was Manilla Post Office (station number 55031).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions identified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 51. Warrah Creek

<b>Water source and model</b>	<b>Warrah Creek: model Warrah Creek</b>	
<b>Water source boundaries</b>	The main stream is the Mooki River with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at a gauging station from an adjacent catchment “Mooki River at Carroona” (419034).</p> <p>The flow sequence extends from 01/08/1965 to 27/10/2009, 44.2 years in total. 0.5% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 0.96.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 426 ML made up of:</p> <ul style="list-style-type: none"> <li>• 420 ML Unregulated category entitlement</li> <li>• 6 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 4 ML/day, which simulated a CtP at the end of the system.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 7.00 ML/day was available for irrigation and 0.02 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Warrah Creek: model Warrah Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Warrah Creek” (419_02) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 22%</li> <li>• Lucerne 44%</li> <li>• Wheat 34%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Warrah Creek system was estimated to be 86 ha.</p> <p>The weather station used was Quirindi Post Office (station number 55049).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.

Table 52. Phillips Creek

<b>Water source and model</b>	<b>Phillips Creek: model Phillips Creek</b>

This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Citrus 1%</li> <li>• Lucerne 90%</li> <li>• Perennial pasture 7%</li> <li>• Wheat 2%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Goonoo Goonoo Creek system was estimated to be 161 ha.</p> <p>The weather station used was Goonoo Goonoo Station (station number 55067).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 59. Upper Peel River

<b>Water source and model</b>	<b>Upper Peel River Tributaries: model Dungowan Creek, and Duncan Creek</b>	
<b>Water source boundaries</b>	The main streams are Dungowan Creek, and Duncan Creek, which flow into the regulated river.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on a nearby gauging station.  The flow sequence extends from 01/01/1892 to 30/06/2008, 116.5 years in total.	
<b>total area factor</b>	The flow sequence was factored for area by 2.00.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (100% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Low
<b>level of entitlement</b>	The total entitlement simulated was 9,643 ML made up of: <ul style="list-style-type: none"> <li>• 4,018 ML Unregulated category entitlement</li> <li>• 5,625 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	The visible flow CtP was simulated by allowing access down to zero flow, which is the same as simulating no CtP.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 66.97 ML/day was available for irrigation and 15.41 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	6,300 ML of on-river dam capacity was simulated. 0% of the unregulated entitlement had access to on-river dams. 100% of the Stock and Domestic and LWU entitlement had access to the on-river dams.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Upper Peel River Tributaries: model Dungowan Creek, and Duncan Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Upper Peel River Tributaries” (419_08) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 6%</li> <li>• Lucerne 77%</li> <li>• Perennial pasture 6%</li> <li>• Intensive Perennial Pasture 4%</li> <li>• Summer Maize 1%</li> <li>• Turf 3%</li> <li>• Wheat 3%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Dungowan Creek, and Duncan Creek system was estimated to be 625ha.</p> <p>The weather station used was Dungowan Station (station number 55171).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>Alluvial groundwater is accessed in the vicinity of these unregulated streams which may also impact on streamflow but these were not simulated.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 60. Lower Peel River Tributaries

<b>Water source and model</b>	<b>Lower Peel River Tributaries: model Sandy Creek, Tumbumburi Creek, Moore Creek, Attunga Creek, and Tangaratta Creek</b>	
<b>Water source boundaries</b>	The main streams are Sandy Creek, Tumbumburi Creek, Moore Creek, Attunga Creek, and Tangaratta Creek, which flow into the regulated river.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on the gauging station “Goonoo Goonoo Creek at Timbumburi” (419035).</p> <p>The flow sequence extends from 01/01/1892 to 30/06/2008, 116.5 years in total.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.88.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 2,530.5 ML made up of:</p> <ul style="list-style-type: none"> <li>• 2,472 ML Unregulated category entitlement</li> <li>• 58.5 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	The visible flow CtP was simulated by allowing access down to zero flow, which is the same as simulating no CtP.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 41.20 ML/day was available for irrigation and 0.16 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Lower Peel River Tributaries: model Sandy Creek, Tumbumburi Creek, Moore Creek, Attunga Creek, and Tangaratta Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Lower Peel River Tributaries” (419_11) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 4%</li> <li>• Lucerne 57%</li> <li>• Perennial pasture 14%</li> <li>• Intensive Perennial Pasture 9%</li> <li>• Summer Maize 7%</li> <li>• Turf 1%</li> <li>• Wheat 8%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Sandy Creek, Tumbumburi Creek, Moore Creek, Attunga Creek, and Tangaratta Creek system was estimated to be 400ha.</p> <p>The weather station used was Tamworth Airport (station number 55054).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	Alluvial groundwater is accessed in the vicinity of these unregulated streams which may also impact on streamflow but these were not simulated.
<b>Licence locations</b>	

Table 61. Rangira Creek

<b>Water source and model</b>	<b>Rangira Creek: model Rangira Creek</b>	
<b>Water source boundaries</b>	The main stream is Rangira Creek with headwater streams flowing into it. In the lower reaches of this stream flow is lost into the alluvium and the river channel peters out.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on a gauging station from an adjacent catchment “Maules Creek at Avoca East” (419051).</p> <p>The flow sequence extends from 01/01/1890 to 31/12/1997, 108.0 years in total.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 0.33.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (10% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,479 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,458 ML Unregulated category entitlement</li> <li>• 21 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	The visible flow CtP was simulated by allowing access down to zero flow, which is the same as simulating no CtP.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 24.30 ML/day was available for irrigation and 0.06 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>1000 ML of on-river dam capacity was simulated.</p> <p>100% of the unregulated entitlement had access to on-river dams.</p> <p>100% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Rangira Creek: model Rangira Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Rangira Creek” (419_22) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Perennial pasture 100%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Rangira Creek system was estimated to be 243ha.</p> <p>The weather station used was Barraba (Mount Lindsay) (station number 54021).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 62. Bluevale

<b>Water source and model</b>	<b>Bluevale: model Deadmans Gully, Driggle Draggie Creek, Bollol Creek, and Collygra Creek</b>	
<b>Water source boundaries</b>	The main streams are Deadmans Gully, Driggle Draggie Creek, Bollol Creek, and Collygra Creek, which flow into the regulated river.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on a gauging station from an adjacent catchment "Maules Creek at Avoca East" (419051).</p> <p>The flow sequence extends from 01/01/1890 to 31/12/1997, 108.0 years in total.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.12.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (56% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Low
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,647 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,635 ML Unregulated category entitlement</li> <li>• 12 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 27.25 ML/day was available for irrigation and 0.03 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>1,000 ML of on-river dam capacity was simulated.</p> <p>100% of the unregulated entitlement had access to on-river dams.</p> <p>100% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.

<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,079 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,072 ML Unregulated category entitlement</li> <li>• ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold (in a decision table) on the inflow above the irrigation pumps of 4 ML/day.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 17.87 ML/day was available for irrigation and 0.02 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Maules Creek: model Maules Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Maules Creek” (419_30) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Cotton 11%</li> <li>• Lucerne 16%</li> <li>• Summer Maize 11%</li> <li>• Wheat 62%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Maules Creek system was estimated to be 244ha.</p> <p>The weather station used was Boggabri (Kanownda) (station number 55076).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>Alluvial groundwater is accessed in the vicinity of these unregulated streams which may also impact on streamflow but these were not simulated.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location above the majority of the irrigation pumps, hence it is simulated as if all pumps are below the trigger point.</p>

Table 67. Eulah Creek

<b>Water source and model</b>	<b>Eulah Creek: model Tulla Mullen Creek, and Bullawa Creek</b>	
<b>Water source boundaries</b>	The main streams are Tulla Mullen Creek, and Bullawa Creek, which flow into the regulated river.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on a gauging station from an adjacent catchment “Maules Creek at Avoca East” (419051).</p> <p>The flow sequence extends from 01/01/1890 to 31/12/1997, 108.0 years in total.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 0.93.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (44% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Low
<b>level of entitlement</b>	<p>The total entitlement simulated was 3,893.75 ML made up of:</p> <ul style="list-style-type: none"> <li>• 3,858.75 ML Unregulated category entitlement</li> <li>• 35 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 40.67 ML/day was available for irrigation and 0.10 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>1,220 ML of on-river dam capacity was simulated.</p> <p>100% of the unregulated entitlement had access to on-river dams.</p> <p>0% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Eulah Creek: model Tulla Mullen Creek, and Bullawa Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Eulah Creek” (419_29) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Cotton 54%</li> <li>• Lucerne 20%</li> <li>• Perennial pasture 4%</li> <li>• Wheat 22%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Tulla Mullen Creek, and Bullawa Creek system was estimated to be 390ha.</p> <p>The weather station used was Turrawan (Wallah) (station number 55058).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 68. Bohena Creek

<b>Water source and model</b>	<b>Bohena Creek: model Bohena Creek</b>	
<b>Water source boundaries</b>	The main stream is Bohena Creek with headwater streams flowing into it. Part of the lower end of the water source has some anabranching channels associated with the regulated river.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Bohena Creek at Newell Highway” (419905).</p> <p>The flow sequence extends from 09/06/1995 to 13/06/2005, 10.0 years in total. There was no need to fill any gaps in the measured flow sequence.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.06.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (0% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 415 ML made up of:</p> <ul style="list-style-type: none"> <li>• 410 ML Unregulated category entitlement</li> <li>• 5 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 6.83 ML/day was available for irrigation and 0.01 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>177 ML of on-river dam capacity was simulated. 43% of the unregulated entitlement had access to on-river dams.</p> <p>0% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Bohena Creek: model Bohena Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Bohena Creek” (419_23) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 24%</li> <li>• Lucerne 47%</li> <li>• Wheat 29%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Bohena Creek system was estimated to be 82ha.</p> <p>The weather station used was Narrabri Bowling Club (station number 54120).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 69. Spring and Bobbiwaa Creeks

<b>Water source and model</b>	<b>Spring and Bobbiwaa Creeks: model Spring Creek</b>	
<b>Water source boundaries</b>	The main stream is Spring Creek with headwater streams flowing into it. In the lower reaches of this stream, flow is lost into the alluvium and the river channel peters out. Part of the lower end of the water source has some small residual streams flowing.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at a gauging station from an adjacent catchment "Brigalow Creek at Tharlane" (419083).</p> <p>The flow sequence extends from 15/10/1993 to 20/01/2010, 16.3 years in total. There was no need to fill any gaps in the measured flow sequence.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 0.78.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	A proportion of the streamflow sequence (54% of the unfactored flow) is able to be accessed by pumps that can fill the on-farm dams.	
<b>Water access</b>		Low
<b>level of entitlement</b>	<p>The total entitlement simulated was 533 ML made up of:</p> <ul style="list-style-type: none"> <li>• 528 ML Unregulated category entitlement</li> <li>• 5 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 17.60 ML/day was available for irrigation and 0.01 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	<p>533 ML of on-farm storage capacity was simulated.</p> <p>100% of the unregulated entitlement had access to on-farm dams.</p> <p>100% of the Stock and Domestic and LWU entitlement had access to the on-farm dams.</p>

<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	

Table 77. Baradine Creek

<b>Water source and model</b>	<b>Baradine Creek: model Baradine Creek</b>	
<b>Water source boundaries</b>	The main stream is Baradine Creek. The stream channel in this area anabranches and the flow is associated with the higher flow in the main river.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on the gauging station "Baradine Creek at Kienbri No.2" (419072).  The flow sequence extends from 01/01/1887 to 30/06/1998, 111.5 years in total.	
<b>total area factor</b>	The flow sequence was factored for area by 1.76.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	A proportion of the streamflow sequence (137% of the unfactored flow) is able to be accessed by pumps that can fill the on-farm dams.	
<b>Water access</b>		Low
<b>level of entitlement</b>	The total entitlement simulated was 288 ML made up of: <ul style="list-style-type: none"> <li>• 276 ML Unregulated category entitlement</li> <li>• 12 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 4.60 ML/day was available for irrigation and 0.03 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	288 ML of on-farm storage capacity was simulated. 100% of the unregulated entitlement had access to on-farm dams. 100% of the Stock and Domestic and LWU entitlement had access to the on-farm dams.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Baradine Creek: model Baradine Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Baradine Creek” (419_13) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 94%</li> <li>• Wheat 6%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Baradine Creek system was estimated to be 40ha.</p> <p>The weather station used was Pilliga Post Office (station number 52023).</p> <p>The crop factor file used was “nthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-farm dams (see sections 'on-farm dam area factor' and 'on-farm dam available').</p>

## Castlereagh unregulated river models

Table 78. Castlereagh River above Binnaway

<b>Water source and model</b>	<b>Castlereagh River above Binnaway: model Castlereagh River</b>
<b>Water source boundaries</b>	The main stream is the Castlereagh River (above Binnaway) with headwater streams flowing into it.
<b>Assumptions</b>	<b>Confidence</b>
<b>Flow sequence</b>	Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Castlereagh River at Binnaway” (420007).</p> <p>The flow sequence extends from 23/09/1965 to 04/09/1981, 15.9 years in total. 0.1% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>
<b>total area factor</b>	The flow sequence was factored for area by 1.00.
<b>on-river dams area factor</b>	No on-river dam simulated.
<b>on-farm dams area factor</b>	No on-farm dams simulated.
<b>Water access</b>	Low
<b>level of entitlement</b>	<p>The total entitlement simulated was 5,722 ML made up of:</p> <ul style="list-style-type: none"> <li>• 4,745 ML Unregulated category entitlement</li> <li>• 18 ML Domestic and Stock category</li> <li>• 959 ML LWU category entitlement.</li> </ul>
<b>access rules (CtP)</b>	A CtP was not simulated.
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.
<b>pump capacity</b>	A pump capacity of 95.37 ML/day was available for irrigation and 0.00 ML/day was available for Stock and Domestic and LWU water extraction.
<b>on-river dam access</b>	No on-river dams simulated.
<b>on-farm storage available</b>	No on-farm storage simulated.
<b>Irrigation pattern</b>	High

<b>Water source and model</b>	<b>Castlereagh River above Binnaway: model Castlereagh River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Castlereagh above Binnaway” (420_21) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 64%</li> <li>• Orchard 4%</li> <li>• Perennial pasture 18%</li> <li>• Summer Maize 2%</li> <li>• Grapes 4%</li> <li>• Wheat 7%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Castlereagh River system was estimated to be 924ha.</p> <p>The weather station used was Coonabarabran (Namoi Street) (station number 64008).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	

Table 79. Binnaway to Gilgandra

<b>Water source and model</b>	<b>Binnaway to Gilgandra: model Castlereagh River</b>	
<b>Water source boundaries</b>	The main stream is the Castlereagh River (Binnaway to Gilgandra) downstream of other water sources that flow into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on the gauging station “Castlereagh River at Mendooran” (420004).</p> <p>The flow sequence extends from 01/01/1883 to 30/12/2002, 120.0 years in total.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Low
<b>level of entitlement</b>	<p>The total entitlement simulated was 13,701 ML made up of:</p> <ul style="list-style-type: none"> <li>• 12,493 ML Unregulated category entitlement</li> <li>• 74 ML Domestic and Stock category</li> <li>• 1,134 ML LWU category entitlement.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 228.35 ML/day was available for irrigation and 0.00 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Binnaway to Gilgandra: model Castlereagh River</b>
crop	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Castlereagh Binnaway Gilgandra” (420_22) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 2%</li> <li>• Fababean 1%</li> <li>• Lucerne 60%</li> <li>• Orchard 1%</li> <li>• Perennial pasture 3%</li> <li>• Summer Maize 5%</li> <li>• Vegetables 13%</li> <li>• Wheat 15%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Castlereagh River system was estimated to be 2,239 ha.</p> <p>The weather station used was Neilrex (Caigan) (station number 64007).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	Alluvial groundwater is accessed in the vicinity of these unregulated streams which may also impact on streamflow but these were not simulated.
<b>Licence locations</b>	

Table 80. Castlereagh River Gilgandra to Coonamble

<b>Water source and model</b>	<b>Castlereagh River Gilgandra to Coonamble: model Castlereagh River</b>
<b>Water source boundaries</b>	The main stream is the Castlereagh River (Gilgandra to Coonamble) downstream of other water sources that flow into it.
<b>Assumptions</b>	<b>Confidence</b>
<b>Flow sequence</b>	Moderate
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. ## Macquarie unregulated river models

Table 82. Bell River

<b>Water source and model</b>	<b>Bell River: model Bell River</b>
<b>Water source boundaries</b>	The main stream is the Bell River downstream of other water sources that flow into it.
<b>Assumptions</b>	<b>Confidence</b>
<b>Flow sequence</b>	High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Bell River at Newrea” (421018).</p> <p>The flow sequence extends from 01/08/1939 to 30/09/2009, 70.2 years in total. 1.4 percent of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>
<b>total area factor</b>	The flow sequence was factored for area by 1.16.
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (20% of the unfactored flow sequence) is able to be captured by on-river dams.
<b>on-farm dams area factor</b>	No on-farm dams simulated.
<b>Water access</b>	High
<b>level of entitlement</b>	<p>The total entitlement simulated was 8,157 ML made up of:</p> <ul style="list-style-type: none"> <li>• 7,138 ML Unregulated category entitlement</li> <li>• 1,019 ML Domestic and Stock category.</li> </ul>
<b>access rules (CtP)</b>	A CtP was not simulated.
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.
<b>pump capacity</b>	A pump capacity of 205ML/day was available for irrigation and 4.5ML/day was available for Stock and Domestic and LWU water extraction.
<b>on-river dam access</b>	<p>100 ML of on-river dam capacity was simulated. 52% of the unregulated entitlement had access to on-river dams.</p> <p>54% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>
<b>on-farm storage available</b>	No on-farm storage simulated.
<b>Irrigation pattern</b>	High

<b>Water source and model</b>	<b>Bell River: model Bell River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Bell River” (421_15) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Citrus 2%</li> <li>• Lucerne 68%</li> <li>• Orchard 6%</li> <li>• Perennial pasture 7%</li> <li>• Summer Maize 1%</li> <li>• Turf 1%</li> <li>• Mixed vegetable crops 8%</li> <li>• Wine Grapes 4%</li> <li>• Wheat 3%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Bell River system was estimated to be 2075ha.</p> <p>The weather station used was Cumnock (Willow Park) (station number 65011).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions identified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 83. Burrendong Dam Tributaries

<b>Water source and model</b>	<b>Burrendong Dam Tributaries: model Burrendong Dam</b>	
<b>Water source boundaries</b>	The main waterbody is Burrendong Dam, which is part of the Regulated System, and it is the small stream that flow into it that make up the unregulated water source. The largest of the streams in the water source is Meroo Creek.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on the gauging station "Meroo Creek at Yarrabin No.2" (421073).</p> <p>The flow sequence extends from 01/01/1890 to 06/07/2009, 119.5 years in total.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.12.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (1% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 584 ML made up of:</p> <ul style="list-style-type: none"> <li>• 572 ML Unregulated category entitlement</li> <li>• 12 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 10 ML/day was available for irrigation and 0.03 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>120 ML of on-river dam capacity was simulated. 43% of the unregulated entitlement had access to on-river dams.</p> <p>100% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Burrendong Dam Tributaries: model Burrendong Dam</b>
crop	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Burrendong Dam Storage Tributaries” (421_10) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 92%</li> <li>• Orchard 8%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Burrendong Dam system was estimated to be 92ha.</p> <p>The weather station used was Hill End Post Office (station number 63035).</p> <p>The crop factor file used was “centab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 84. Campbells River

<b>Water source and model</b>	<b>Campbells River: model Campbells River</b>	
<b>Water source boundaries</b>	The main stream is the Campbells River with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on the gauging station "Campbells River upstream Ben Chifley Dam" (421101).  The flow sequence extends from 01/01/1890 to 06/07/2009, 119.5 years in total.	
<b>total area factor</b>	The flow sequence was factored for area by 1.19.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	The total entitlement simulated was 2,106 ML made up of: 2,058 ML Unregulated category entitlement 48 ML Domestic and Stock category	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 34 ML/day was available for irrigation and 0.13 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Campbells River: model Campbells River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Campbells River” (421_01) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 61%</li> <li>• Perennial pasture 1%</li> <li>• Mixed vegetable crops 37%</li> <li>• Wine Grapes 1%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Campbells River system was estimated to be 468ha.</p> <p>The weather station used was O'connell (Stratford) (station number 63064).</p> <p>The crop factor file used was “centab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	

Table 85. Coolbaggie Creek

<b>Water source and model</b>	<b>Coolbaggie Creek: model Coolbaggie Creek</b>	
<b>Water source boundaries</b>	The main stream is Coolbaggie Creek with headwater streams flowing into it. Part of the lower end of the water source has some small residual streams flowing into the trunk stream.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Coolbaggie Creek at Rawsonville” (421055).</p> <p>The flow sequence extends from 01/02/1966 to 17/03/2009, 43.1 years in total. 4.8 percent of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (1% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 0 ML made up of:</p> <ul style="list-style-type: none"> <li>• 454 ML Unregulated category entitlement</li> <li>• 12 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 8 ML/day was available for irrigation and 0.03 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>116 ML of on-river dam capacity was simulated. 93% of the unregulated entitlement had access to on-river dams.</p> <p>100% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Moderate

<b>Water source and model</b>	<b>Coolbaggie Creek: model</b> <b>Coolbaggie Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Maryvale-Geurie” (421_18) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Canola 2%</li> <li>• Lucerne 33%</li> <li>• Summer Maize 11%</li> <li>• Mixed vegetable crops 2%</li> <li>• Wheat 52%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Coolbaggie Creek system was estimated to be 93 ha.</p> <p>The weather station used was Dubbo (Darling Street) (station number 65012).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 86. Cooyal Wialdra Creek

<b>Water source and model</b>	<b>Cooyal Wialdra Creek: model Wialdra Creek</b>	
<b>Water source boundaries</b>	The main stream is Wialdra Creek with headwater streams flowing into it. Its main tributaries are Slapdash Creek and Cooyal Creek.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on the gauging station "Wyaldra Creek at Gulgong" (421058).</p> <p>The flow sequence extends from 01/01/1882 to 07/07/2009, 127.5 years in total.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	No on-river dam simulated.

Table 87. Lawsons Creek

<b>Water source and model</b>	<b>Lawsons Creek: model Lawsons Creek</b>	
<b>Water source boundaries</b>	The main stream is Lawsons Creek with headwater streams flowing into it. Part of the lower end of the water source has some small residual streams flowing into the trunk stream.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Cudgegong River at Rylstone Bridge” (421038).</p> <p>The flow sequence extends from 01/03/1957 to 30/06/1980, 23.3 years in total. 0.6 percent of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 0.85.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (25% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,496 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,443 ML Unregulated category entitlement</li> <li>• 53 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 24 ML/day was available for irrigation and 0.15 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>184 ML of on-river dam capacity was simulated. 23% of the unregulated entitlement had access to on-river dams.</p> <p>70% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Lawsons Creek: model Lawsons Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Lawsons Creek” (421_09) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 81%</li> <li>• Perennial pasture 1%</li> <li>• Turf 1%</li> <li>• Wine Grapes 10%</li> <li>• Wheat 7%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Lawsons Creek system was estimated to be 264 ha.</p> <p>The weather station used was Rylstone (Ilford Rd) (station number 62026).</p> <p>The crop factor file used was “centab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 88. Little River

<b>Water source and model</b>	<b>Little River: model Little River</b>	
<b>Water source boundaries</b>	The main stream is the Little River with headwater streams flowing into it. Part of the lower end of the water source has some small residual streams flowing into the trunk stream.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on the gauging station "Little River at Arthurville No. 2" (421176).</p> <p>The flow sequence extends from 01/01/1889 to 06/07/2009, 120.5 years in total.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.14.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (6% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Low
<b>level of entitlement</b>	<p>The total entitlement simulated was 2,272 ML made up of:</p> <ul style="list-style-type: none"> <li>• 2,131 ML Unregulated category entitlement</li> <li>• 141 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 36 ML/day was available for irrigation and 0.39 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>58 ML of on-river dam capacity was simulated.</p> <p>75% of the unregulated entitlement had access to on-river dams.</p> <p>75% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	xxx
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Little River: model Little River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Little River” (421_17) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 9%</li> <li>• Lucerne 45%</li> <li>• Perennial pasture 7%</li> <li>• Summer Maize 17%</li> <li>• Turf 4%</li> <li>• Wheat 18%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Little River system was estimated to be 364ha.</p> <p>The weather station used was Cumnock (Willow Park) (station number 65011).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 89. Lower Talbragar River

<b>Water source and model</b>	<b>Lower Talbragar River: model Lower Talbragar River</b>	
<b>Water source boundaries</b>	The main stream is the Lower Talbragar River downstream of other water sources that flow into it. The inflowing water source is the Upper Talbragar River water source.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Talbragar River at Emanon” (421163).</p> <p>The flow sequence extends from 31/12/1980 to 09/12/1997, 16.9 years in total. 10.5 percent of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (0% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 2,251 ML made up of:</p> <ul style="list-style-type: none"> <li>• 2,227 ML Unregulated category entitlement</li> <li>• 24 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 43 ML/day was available for irrigation and 0.08 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>869 ML of on-river dam capacity was simulated. 71% of the unregulated entitlement had access to on-river dams.</p> <p>0% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Lower Talbragar River: model</b> <b>Lower Talbragar River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Lower Talbragar” (421_20) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 67%</li> <li>• Summer Maize 33%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Lower Talbragar River system was estimated to be 400 ha.</p> <p>The weather station used was Dunedoo Post Office (station number 64009).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 90. Macquarie River above Burrendong

<b>Water source and model</b>	<b>Macquarie River above Burrendong: model Macquarie River above Burrendong</b>
<b>Water source boundaries</b>	The main stream is the Macquarie River above Burrendong downstream of other water sources that flow into it.
<b>Assumptions</b>	<b>Confidence</b>
<b>Flow sequence</b>	High
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on the gauging station “Macquarie River at Dixons Long Point” (421080).</p> <p>The flow sequence extends from 01/01/1890 to 06/07/2009, 119.5 years in total.</p>
<b>total area factor</b>	The flow sequence was factored for area by 1.02.
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (8% of the unfactored flow sequence) is able to be captured by on-river dams.
<b>on-farm dams area factor</b>	No on-farm dams simulated.
<b>Water access</b>	Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 25,586 ML made up of:</p> <ul style="list-style-type: none"> <li>• 8,032 ML Unregulated category entitlement</li> <li>• 54 ML Domestic and Stock category</li> <li>• 17,500 ML LWU category entitlement.</li> </ul>
<b>access rules (CtP)</b>	A CtP was not simulated.
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.
<b>pump capacity</b>	A pump capacity of 314 ML/day was available for irrigation and 116.69 ML/day was available for Stock and Domestic and LWU water extraction.
<b>on-river dam access</b>	<p>22,628 ML of on-river dam capacity was simulated.</p> <p>17% of the unregulated entitlement had access to on-river dams.</p> <p>99% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>
<b>on-farm storage available</b>	No on-farm storage simulated.
<b>Irrigation pattern</b>	High

<b>Water source and model</b>	<b>Macquarie River above Burrendong: model Macquarie River above Burrendong</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Macquarie Above Burrendong” (421_04) was used. <b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A rainfall runoff modeled flow sequence was used to represent the streamflow available to be extracted. This flow was based on the gauging station "Lewis Ponds Creek at Ophir" (421052).</p> <p>The flow sequence extends from 01/01/1889 to 06/07/2009, 120.5 years in total.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.36.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (39% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 11,765 ML made up of:</p> <ul style="list-style-type: none"> <li>• 3,796 ML Unregulated category entitlement</li> <li>• 169 ML Domestic and Stock category</li> <li>• 7,800 ML LWU category entitlement.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 63 ML/day was available for irrigation and 21.83 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>1,159 ML of on-river dam capacity was simulated.</p> <p>59% of the unregulated entitlement had access to on-river dams.</p> <p>99% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Summerhill Creek: model Lewis Ponds Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Summerhill Creek” (421_07) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 6%</li> <li>• Lucerne 3%</li> <li>• Orchard 83%</li> <li>• Perennial pasture 4%</li> <li>• Mixed vegetable crops 4%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Lewis Ponds Creek system was estimated to be 671 ha.</p> <p>The weather station used was Orange (Mclaughlin St) (station number 63066).</p> <p>The crop factor file used was “centab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 97. Turon Crudine River

<b>Water source and model</b>	<b>Turon Crudine River: model Turon River and its tributary the Crudine River</b>	
<b>Water source boundaries</b>	The main streams are Turon River and its tributary the Crudine River with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station "Turon River at Sofala" (421026).</p> <p>The flow sequence extends from 10/09/1947 to 26/05/2009, 61.7 years in total. 3.3 percent of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.79.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 328 ML made up of:</p> <ul style="list-style-type: none"> <li>• 316 ML Unregulated category entitlement</li> <li>• 12 ML Domestic and Stock category.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 5ML/day was available for irrigation and 0.03ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Turon Crudine River: model Turon River and its tributary the Crudine River</b>
crop	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Turon Crudine River” (421_06) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 73%</li> <li>• Mixed vegetable crops 2%</li> <li>• Wine Grapes 25%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Turon River and its tributary the Crudine River system was estimated to be 61ha.</p> <p>The weather station used was Sofala Old Post Office (station number 63076).</p> <p>The crop factor file used was “centab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	

Table 98. Upper Bogan River

<b>Water source and model</b>	<b>Upper Bogan River: model Bogan River</b>	
<b>Water source boundaries</b>	The main stream is the Bogan River with headwater streams flowing into it. The end of this water sources is only half way along the river.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Bogan River at Dandaloo” (421083).</p> <p>The flow sequence extends from 01/12/1971 to 23/10/2008, 36.9 years in total. 30.5 percent of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.31.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (21% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,735 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,463 ML Unregulated category entitlement</li> <li>• 90 ML Domestic and Stock category</li> <li>• 182 high flowML LWU category entitlement.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 24 ML/day was available for irrigation and 0.25 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>264 ML of on-river dam capacity was simulated. 53% of the unregulated entitlement had access to on-river dams.</p> <p>69% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Upper Bogan River: model Bogan River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Upper Bogan River Catchment” (421_25) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 2%</li> <li>• Fababean 5%</li> <li>• Lucerne 38%</li> <li>• Perennial pasture 2%</li> <li>• Soybeans 14%</li> <li>• Summer Maize 10%</li> <li>• Wheat 29%.</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Bogan River system was estimated to be 272ha.</p> <p>The weather station used was Goolma (Brooklyn) (station number 62028).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 99. Upper Cudgegong River

<b>Water source and model</b>	<b>Upper Cudgegong River: model Cudgegong River</b>	
<b>Water source boundaries</b>	The main stream is the Cudgegong River with headwater streams flowing into it. It provides the major inflows to Windanere Dam.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Cudgegong River at Rylstone Bridge” (421038).</p> <p>The flow sequence extends from 01/03/1957 to 30/06/1980, 23.3 years in total. 0.6 percent of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.34.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (73% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 6,451.5 ML made up of:</p> <ul style="list-style-type: none"> <li>• 3,882 ML Unregulated category entitlement</li> <li>• 69.5 ML Domestic and Stock category</li> <li>• 2,500 ML LWU category entitlement.</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 65 ML/day was available for irrigation and 7.04 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>1,758 ML of on-river dam capacity was simulated.</p> <p>25% of the unregulated entitlement had access to on-river dams.</p> <p>99% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Upper Cudgegong River: model Cudgegong River</b>

<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 140 ML/day was available for irrigation and 4.08 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>264 ML of on-river dam capacity was simulated. 7% of the unregulated entitlement had access to on-river dams.</p> <p>0% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	

<b>Water source and model</b>	<b>Bulbodney Grahway Creek: model Bogan River</b>	
<b>Irrigation pattern</b>		High
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Bulbodney - Grahway Creek System” (421_26) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Canola 8%</li> <li>• Fababean 3%</li> <li>• Lucerne 41%</li> <li>• Soybeans 14%</li> <li>• Wheat 34%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Bogan River system was estimated to be 1684ha.</p> <p>The weather station used was Tottenham (Burdenda) (station number 50011).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>	
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.	
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').	

## Lachlan unregulated river models

Table 106. Lachlan River above Reids Flat

<b>Water source and model</b>	<b>Lachlan River above Reids Flat: model Lachlan River (upstream of Wyangala Dam)</b>	
<b>Water source boundaries</b>	The main stream is the Lachlan River (upstream of Wyangala Dam) downstream of other water sources that flow into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Lachlan River at Reids Flat” (412027).</p> <p>The flow sequence extends from 01/12/1930 to 30/10/1967, 36.9 years in total. 0.4% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.03.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (5% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 2,016.5 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,872 ML Unregulated category entitlement</li> <li>• 34.5 ML Domestic and Stock category</li> <li>• 110 ML LWU category entitlement</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 2ML/day, which simulated a CtP at the end of the system.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 52.02 ML/day was available for irrigation and 1.51 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>1,373 ML of on-river dam capacity was simulated.</p> <p>22% of the unregulated entitlement had access to on-river dams.</p> <p>97% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	

<b>Water source and model</b>	<b>Lachlan River above Reids Flat: model Lachlan River (upstream of Wyangala Dam)</b>
<b>on-farm storage available</b>	No on-farm storage simulated.
<b>Irrigation pattern</b>	High
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit "Lachlan River above Reid's Flat" (412_01) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 5%</li> <li>• Lucerne 14%</li> <li>• Perennial pasture 33%</li> <li>• Summer Maize 12%</li> <li>• Vegetables 12%</li> <li>• Wheat 24%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Lachlan River (upstream of Wyangala Dam) system was estimated to be 715ha.</p> <p>The weather station used was Gunning Rural Supplies (station number 70043).</p> <p>The crop factor file used was "sthtab6ed.crp", which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	<p>The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.</p> <p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 107. Crookwell River

<b>Water source and model</b>	<b>Crookwell River: model Crookwell River</b>	
<b>Water source boundaries</b>	The main stream is the Crookwell River with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Crookwell River at Narrawa North” (412050).</p> <p>The flow sequence extends from 21/01/1955 to 25/05/2011, 56.3 years in total. 22.9% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.04.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (19% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,655 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,249 ML Unregulated category entitlement</li> <li>• 6 ML Domestic and Stock category</li> <li>• 400 ML LWU category entitlement</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 2ML/day, which simulated a CtP at the end of the system.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 20.82 ML/day was available for irrigation and 1.11 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>1,072 ML of on-river dam capacity was simulated.</p> <p>54% of the unregulated entitlement had access to on-river dams.</p> <p>100% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	

<b>Water source and model</b>	<b>Crookwell River: model Crookwell River</b>	
<b>Irrigation pattern</b>		High
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Crookwell River” (412_02) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 14%</li> <li>• Lucerne 32%</li> <li>• Perennial pasture 19%</li> <li>• Summer Maize 7%</li> <li>• Vegetables 17%</li> <li>• Wheat 11%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Crookwell River system was estimated to be 332ha.</p> <p>The weather station used was Crookwell Post Office (station number 70025).</p> <p>The crop factor file used was “centab6ed.crp”, which was developed for the licence conversion process.</p>	
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.	
<b>Licence locations</b>	<p>The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.</p> <p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>	

Table 108. Abercrombie River above Wyangala

<b>Water source and model</b>	<b>Abercrombie River above Wyangala: model Abercrombie River (but it also includes Wyangala Dam itself)</b>	
<b>Water source boundaries</b>	The main stream is the Abercrombie River (but it also includes Wyangala Dam itself) with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Abercrombie River at Abercrombie” (412028).</p> <p>The flow sequence extends from 09/12/1930 to 13/09/2011, 80.8 years in total. 0.7% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.51.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (1% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,003 ML made up of:</p> <ul style="list-style-type: none"> <li>• 969 ML Unregulated category entitlement</li> <li>• 34 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 7ML/day, which simulated a CtP at the end of the system.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 16.15 ML/day was available for irrigation and 0.09 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>323 ML of on-river dam capacity was simulated. 33% of the unregulated entitlement had access to on-river dams.</p> <p>29% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	

<b>Water source and model</b>	<b>Abercrombie River above Wyangala: model Abercrombie River (but it also includes Wyangala Dam itself)</b>
<b>Irrigation pattern</b>	High
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Abercrombie River above Wyangala” (412_03) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 67%</li> <li>• Perennial pasture 6%</li> <li>• Summer Maize 4%</li> <li>• Vegetables 22%</li> <li>• Wheat 1%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Abercrombie River (but it also includes Wyangala Dam itself) system was estimated to be 212 ha.</p> <p>The weather station used was Tuena (Wyoming) (station number 63271).</p> <p>The crop factor file used was “centab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	<p>The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.</p> <p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 109. Boorowa River and Hovells Creek

<b>Water source and model</b>	<b>Boorowa River and Hovells Creek: model Boorowa River</b>	
<b>Water source boundaries</b>	The main stream is the Boorowa River with headwater streams flowing into it. Note the water source also includes the smaller separate Hovells Creek system.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Boorowa River at Prossers Crossing” (412029).</p> <p>The flow sequence extends from 01/07/1938 to 22/12/2008, 70.5 years in total. 4.7% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.42.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (38% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,187 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,128 ML Unregulated category entitlement</li> <li>• 59 ML Domestic and Stock category</li> <li>• 0ML LWU category entitlement</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 18.80 ML/day was available for irrigation and 0.16 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>131 ML of on-river dam capacity was simulated. 9% of the unregulated entitlement had access to on-river dams.</p> <p>14% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Boorowa River and Hovells Creek: model Boorowa River</b>
crop	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Boorowa River and Hovell’s Creek” (412_04) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 1%</li> <li>• Lucerne 65%</li> <li>• Wheat 34%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Boorowa River system was estimated to be 245ha.</p> <p>The weather station used was Boorowa Post Office (station number 70220).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 110. Waugoola Creek

<b>Water source and model</b>	<b>Waugoola Creek: model Waugoola Creek</b>	
<b>Water source boundaries</b>	The main stream is Waugoola Creek, which flow into the regulated river. Part of the lower end of the water source has some small residual streams flowing into the trunk stream.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Waugoola Creek upstream Cowra” (412091).</p> <p>The flow sequence extends from 25/08/1971 to 22/12/1994, 23.3 years in total. 0.7% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (8% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 359 ML made up of:</p> <ul style="list-style-type: none"> <li>• 341 ML Unregulated category entitlement</li> <li>• 18 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 5.68 ML/day was available for irrigation and 0.05 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>100 ML of on-river dam capacity was simulated. 28% of the unregulated entitlement had access to on-river dams.</p> <p>33% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Waugoola Creek: model Waugoola Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Waugoola Creek” (412_05) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 100%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Waugoola Creek system was estimated to be 57 ha.</p> <p>The weather station used was Cowra Ag Research Station (station number 63022).</p> <p>The crop factor file used was “centab6ed.crp”, which was developed for the licence conversion process.</p>

<b>Licence locations</b>	

Table 112. Belubula Tributaries below Carcoar Dam

<b>Water source and model</b>	<b>Belubula Tributaries below Carcoar Dam: model Belubula Tributaries below Carcoar Dam</b>	
<b>Water source boundaries</b>	The main waterbody is Belubula Tributaries below Carcoar Dam, which flow into the regulated river.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Flyers Creek at Beneree” (412080).</p> <p>The flow sequence extends from 17/04/1968 to 17/08/2011, 43.3 years in total. 12.0% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 3.82.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (32% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 9,583 ML made up of:</p> <ul style="list-style-type: none"> <li>• 6,380 ML Unregulated category entitlement</li> <li>• 53 ML Domestic and Stock category</li> <li>• 3,150 ML LWU category entitlement</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 19.83 ML/day was available for irrigation and 8.79 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>361 ML of on-river dam capacity was simulated. 61% of the unregulated entitlement had access to on-river dams.</p> <p>100% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Belubula Tributaries below Carcoar Dam: model Belubula Tributaries below Carcoar Dam</b>
crop	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Belubula Tributaries below Carcoar Dam” (412_07) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 3%</li> <li>• Cotton 2%</li> <li>• Lucerne 17%</li> <li>• Pecans 6%</li> <li>• Perennial pasture 9%</li> <li>• Vegetables 34%</li> <li>• Grapes 26%</li> <li>• Wheat 3%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Belubula Tributaries below Carcoar Dam system was estimated to be 281ha.</p> <p>The weather station used was Canowindra (Canowindra Street) (station number 65006).</p> <p>The crop factor file used was “centab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 113. Mandagery Creek

<b>Water source and model</b>	<b>Mandagery Creek: model Mandagery Creek</b>	
<b>Water source boundaries</b>	The main stream is Mandagery Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Mandagery Creek upstream Eugowra (Smithfield)” (412030).</p> <p>The flow sequence extends from 27/04/1938 to 03/08/2011, 73.3 years in total. 10.9% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.24.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 7,838 ML made up of:</p> <ul style="list-style-type: none"> <li>• 7,750 ML Unregulated category entitlement</li> <li>• 88 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 10 ML/day, which simulated a CtP at the end of the system.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 129.17 ML/day was available for irrigation and 0.24 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Mandagery Creek: model Mandagery Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Mandagery Creek” (412_08) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 4%</li> <li>• Lucerne 85%</li> <li>• Orchard 3%</li> <li>• Perennial pasture 2%</li> <li>• Summer Maize 1%</li> <li>• Vegetables 3%</li> <li>• Grapes 1%</li> <li>• Wheat 1%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Mandagery Creek system was estimated to be 1,310 ha.</p> <p>The weather station used was Cudal Post Office (station number 65010).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions identified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.</p>

Table 114. Goonigal and Kangaroo Creek

<b>Water source and model</b>	<b>Goonigal and Kangaroo Creek: model Goonigal and Kangaroo Creek</b>	
<b>Water source boundaries</b>	The main streams are Goonigal and Kangaroo Creek, which flow into the regulated river. Part of the lower end of the water source has some small residual streams flowing into the trunk stream.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Poor
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station "Goonigal Creek at Gooloogong" (412068).</p> <p>The flow sequence extends from 25/08/1966 to 06/04/2004, 37.6 years in total. 5.1% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 2.01.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (1% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,107 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,103 ML Unregulated category entitlement</li> <li>• 4 ML Domestic and Stock category</li> <li>• 0,ML LWU category entitlement</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 9.70 ML/day was available for irrigation and 0.01 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>255 ML of on-river dam capacity was simulated. 46% of the unregulated entitlement had access to on-river dams.</p> <p>100% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	

<b>Water source and model</b>	<b>Goonigal and Kangarooby Creeks: model Goonigal and Kangarooby Creeks</b>	
<b>Irrigation pattern</b>		Moderate
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Crowther Creek” (412_13) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Orchard 100%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Goonigal and Kangarooby Creeks system was estimated to be 68 ha.</p> <p>The weather station used was Grenfell (Manganese Rd) (station number 73014).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>	
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.	
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').	

Table 115. Tyagong Creek

<b>Water source and model</b>	<b>Tyagong Creek: model Tyagong Creek</b>	
<b>Water source boundaries</b>	The main stream is Tyagong Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at a gauging station from an adjacent catchment "Back Creek at Koorawatha" (412072).</p> <p>The flow sequence extends from 01/09/1966 to 10/03/1989, 22.5 years in total. 0.1% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.02.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 184 ML made up of:</p> <ul style="list-style-type: none"> <li>• 184 ML Unregulated category entitlement</li> <li>• 0 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 3.07 ML/day was available for irrigation and 0.00 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Tyagong Creek: model Tyagong Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Tyagong Creek” (412_11) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <p style="padding-left: 40px;">Lucerne 100%</p> <p>The total area irrigated (based on the full development of the entitlement) in the Tyagong Creek system was estimated to be 28ha.</p> <p>The weather station used was Grenfell (Manganese Rd) (station number 73014).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	

Table 116. Burrangong Creek

<b>Water source and model</b>	<b>Burrangong Creek: model Burrangong Creek</b>	
<b>Water source boundaries</b>	The main stream is Burrangong Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at a gauging station from an adjacent catchment "Back Creek at Koorawatha" (412072).</p> <p>The flow sequence extends from 01/09/1966 to 10/03/1989, 22.5 years in total. 0.1% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 0.78.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (8% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 2,554.5 ML made up of:</p> <ul style="list-style-type: none"> <li>• 2,501.5 ML Unregulated category entitlement</li> <li>• 53 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 41.69 ML/day was available for irrigation and 0.15 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>740 ML of on-river dam capacity was simulated. 59% of the unregulated entitlement had access to on-river dams.</p> <p>25% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Burrangong Creek: model Burrangong Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Burrangong Creek” (412_12) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 15%</li> <li>• Orchard 81%</li> <li>• Vegetables 1%</li> <li>• Grapes 2%</li> <li>• Wheat 1%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Burrangong Creek system was estimated to be 297ha.</p> <p>The weather station used was Wombat (Tumbleton) (station number 73041).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 117. Crowther Creek

<b>Water source and model</b>	<b>Crowther Creek: model Crowther Creek</b>	
<b>Water source boundaries</b>	The main stream is Crowther Creek with headwater streams flowing into it. Part of the lower end of the water source has some small residual streams flowing into the trunk stream.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station "Back Creek at Koorawatha" (412072).</p> <p>The flow sequence extends from 01/09/1966 to 10/03/1989, 22.5 years in total. 0.1% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 2.13.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (2% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,404 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,363 ML Unregulated category entitlement</li> <li>• 41 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 22.72 ML/day was available for irrigation and 0.11 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>498 ML of on-river dam capacity was simulated. 73% of the unregulated entitlement had access to on-river dams.</p> <p>24% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Crowther Creek: model Crowther Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. Table 120. Goobang and Billabong Creeks

<b>Water source and model</b>	<b>Goobang and Billabong Creeks: model Goobang Creek</b>	
<b>Water source boundaries</b>	The main stream is Goobang Creek with headwater streams flowing into it. A major tributary in the headwaters is Billabong Creek.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Goobang Creek at Darby S Dam” (412043).</p> <p>The flow sequence extends from 24/08/1947 to 14/11/1982, 35.2 years in total. 1.4% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.01.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (4% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 3,718 ML made up of:</p> <ul style="list-style-type: none"> <li>2,200 ML Unregulated category entitlement</li> <li>18 ML Domestic and Stock category</li> <li>1,500 ML LWU category entitlement</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 36.67 ML/day was available for irrigation and 4.11 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>750 ML of on-river dam capacity was simulated. 27% of the unregulated entitlement had access to on-river dams.</p> <p>100% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Goobang and Billabong Creeks: model Goobang Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Goobang - Billabong Creeks” (412_17) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 38%</li> <li>• Perennial pasture 17%</li> <li>• Summer Maize 14%</li> <li>• Wheat 31%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Goobang Creek system was estimated to be 401ha.</p> <p>The weather station used was Forbes (Camp Street) (station number 65016).</p> <p>The crop factor file used was “cenwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

## Murrumbidgee unregulated river models

Table 121. Yass Lower

<b>Water source and model</b>	<b>Yass Lower: model Yass River</b>	
<b>Water source boundaries</b>	The main stream is the Yass River downstream of other water sources that flow into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Yass River at Yass” (410026).</p> <p>The flow sequence extends from 25/08/1915 to 28/08/2011, 96.0 years in total. 36.9% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.30.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (99% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 3838.45ML made up of:</p> <ul style="list-style-type: none"> <li>• 2,052.2 ML Unregulated category entitlement</li> <li>• 1,786.25 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The visible flow CtP was simulated by allowing access down to zero flow, which is the same as simulating no CtP.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 34.20 ML/day was available for irrigation and 4.89ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>500 ML of on-river dam capacity was simulated. 0% of the unregulated entitlement had access to on-river dams.</p> <p>95% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Yass Lower: model Yass River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Yass Lower” (410_27) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 13%</li> <li>• Perennial pasture 13%</li> <li>• Turf 13%</li> <li>• Vegetables 61%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Yass River system was estimated to be 334ha.</p> <p>The weather station used was Yass (Linton Hostel) (station number 70091).</p> <p>The crop factor file used was “sthtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions identified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 122. Yass Upper

<b>Water source and model</b>	<b>Yass Upper: model Yass River</b>	
<b>Water source boundaries</b>	The main stream is the Yass River with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Yass River at Yass” (410026).</p> <p>The flow sequence extends from 25/08/1915 to 28/08/2011, 96.0 years in total. 36.9% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 0.95.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (5% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,662.2 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,605.2 ML Unregulated category entitlement</li> <li>• 57 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold (in a decision table) on the inflow above the irrigation pumps of (equivalent of 45ML at the upstream inflow node) 6 ML/day.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 26.75 ML/day was available for irrigation and 0.16ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>200 ML of on-river dam capacity was simulated. 20% of the unregulated entitlement had access to on-river dams.</p> <p>49% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Yass Upper: model Yass River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Yass Upper” (410_28) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 8%</li> <li>• Citrus 3%</li> <li>• Lucerne 52%</li> <li>• Perennial pasture 28%</li> <li>• Vegetables 5%</li> <li>• Grapes 4%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Yass River system was estimated to be 319ha.</p> <p>The weather station used was Gundaroo (Bairnsdale) (station number 70042).</p> <p>The crop factor file used was “sthtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location above the majority of the irrigation pumps, hence it is simulated as if all pumps are below the trigger point.</p> <p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 123. Adjungbilly/Bombowlee/Brungle

<b>Water source and model</b>	<b>Adjungbilly/Bombowlee/Brungle: model Killimicat Creek</b>	
<b>Water source boundaries</b>	The main stream is Killimicat Creek, which flow into the regulated river.	
<b>Assumptions</b>	<b>Confidence</b>	
<b>Flow sequence</b>	Low	
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Killimicat Creek at Wyangle” (410114).</p> <p>The flow sequence extends from 29/05/1975 to 09/09/2015, 40.3 years in total. 0.5% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 3.07.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>	High	
<b>level of entitlement</b>	<p>The total entitlement simulated was 124 ML made up of:</p> <ul style="list-style-type: none"> <li>• 124 ML Unregulated category entitlement</li> <li>• 0 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The visible flow CtP was simulated by allowing access down to zero flow, which is the same as simulating no CtP.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 2.07 ML/day was available for irrigation and 0.00 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>	Moderate	

<b>Water source and model</b>	<b>Adjungbilly/Bombowlee/Brungle: model Killimicat Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Adjungbilly/Bombowlee/Brungle” (410_25) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 3%</li> <li>• Lucerne 31%</li> <li>• Orchard 38%</li> <li>• Perennial pasture 27%</li> <li>• Vegetables 1%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Killimicat Creek system was estimated to be 20ha.</p> <p>The weather station used was Cavan (station number 70019).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	

Table 124. Adjungbilly/Bombowlee/Brungle

<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.	
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').	

Table 131. Houlaghans

<b>Water source and model</b>	<b>Houlaghans: model Houlaghans Creek</b>	
<b>Water source boundaries</b>	The main stream is Houlaghans Creek with headwater streams flowing into it.	
<b>Assumptions</b>	<b>Confidence</b>	
<b>Flow sequence</b>	Moderate	
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Houlaghans Creek at Downside” (410103).</p> <p>The flow sequence extends from 18/07/1980 to 06/09/2011, 31.1 years in total. There was no need to fill any gaps in the measured flow sequence.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (100% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>	High	
<b>level of entitlement</b>	<p>The total entitlement simulated was 22 ML made up of:</p> <ul style="list-style-type: none"> <li>• 10 ML Unregulated category entitlement</li> <li>• 12 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 0.17 ML/day was available for irrigation and 0.03 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>15 ML of on-river dam capacity was simulated. 100% of the unregulated entitlement had access to on-river dams.</p> <p>42% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>	Moderate	

<b>Water source and model</b>	<b>Houlaghans: model Houlaghans Creek</b>
crop	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Burkes/Bullenbung” (410_32) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 95%</li> <li>• Perennial pasture 5%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Houlaghans Creek system was estimated to be 2ha.</p> <p>The weather station used was Wagga Wagga Agricultural Institute (station number 73127).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').

Table 132. Hillas

<b>Water source and model</b>	<b>Hillas: model Hillas Creek</b>	
<b>Water source boundaries</b>	The main stream is Hillas Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station "Hillas Creek at Mount Adrah" (410043).</p> <p>The flow sequence extends from 08/06/1938 to 18/04/2011, 72.9 years in total. 74.3% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.22. Of this factor 0.5965 was not available to be accessed by licence holders.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,543.1 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,513.1 ML Unregulated category entitlement</li> <li>• 30 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold (in a decision table) on the inflow above the irrigation pumps of (equivalent of 4.9ML at the upstream inflow node) 8 ML/day.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 25.22 ML/day was available for irrigation and 0.08 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Hillas: model Hillas Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Hillas” (410_19) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 3%</li> <li>• Lucerne 9%</li> <li>• Orchard 78%</li> <li>• Perennial pasture 10%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Hillas Creek system was estimated to be 217ha.</p> <p>The weather station used was Mundarlo (Yabtree) (station number 73055).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions identified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location above the majority of the irrigation pumps, hence it is simulated as if all pumps are below the trigger point.</p>

Table 133. Goodradigbee

<b>Water source and model</b>	<b>Goodradigbee: model Goodradigbee River</b>	
<b>Water source boundaries</b>	The main stream is the Goodradigbee River with headwater streams flowing into it. It flows directly in to Burrinjuck Dam.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Goodradigbee River at Wee Jasper (Kashmir)” (410024).</p> <p>The flow sequence extends from 19/09/1914 to 27/07/2011, 96.9 years in total. 0.1% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.07.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 875 ML made up of:</p> <ul style="list-style-type: none"> <li>• 874 ML Unregulated category entitlement</li> <li>• 1 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold (in a decision table) on the inflow above the irrigation pumps of (equivalent of 48.3 ML at the upstream inflow node) 45 ML/day.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 14.57 ML/day was available for irrigation and 0.00 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Goodradigbee: model Goodradigbee River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Goobarragandra” (410_15) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 7%</li> <li>• Fababean 2%</li> <li>• Lucerne 18%</li> <li>• Pecans 1%</li> <li>• Perennial pasture 67%</li> <li>• Summer Maize 2%</li> <li>• Vegetables 3%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Goodradigbee River system was estimated to be 168ha.</p> <p>The weather station used was Cavan (station number 70019).</p> <p>The crop factor file used was “sthtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions identified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location above the majority of the irrigation pumps, hence it is simulated as if all pumps are below the trigger point.</p>

Table 140. Kyeamba Creek

<b>Water source and model</b>	<b>Kyeamba: model Kyeamba Creek</b>	
<b>Water source boundaries</b>	The main stream is Kyeamba Creek with headwater streams flowing into it.	
<b>Assumptions</b>	<b>Confidence</b>	
<b>Flow sequence</b>	Low	
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Kyeamba Creek at Book Book” (410156).</p> <p>The flow sequence extends from 12/07/1985 to 08/10/2015, 30.2 years in total. There was no need to fill any gaps in the measured flow sequence.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 4.13.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>	Moderate	
<b>level of entitlement</b>	<p>The total entitlement simulated was 406 ML made up of:</p> <ul style="list-style-type: none"> <li>• 388 ML Unregulated category entitlement</li> <li>• 18 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 1 ML/day, which simulated a CtP at the end of the system.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 6.47 ML/day was available for irrigation and 0.05 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>	High	

<b>Water source and model</b>	<b>Kyeamba: model Kyeamba Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Kyeamba” (410_31) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 2%</li> <li>• Lucerne 25%</li> <li>• Intensive perenial pasture 41%</li> <li>• Summer Maize 15%</li> <li>• Wheat 17%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Kyeamba Creek system was estimated to be 64ha.</p> <p>The weather station used was Wagga Wagga Amo (station number 72150).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.

Table 141. Lake George

<b>Water source and model</b>	<b>Lake George: model Lake George</b>	
<b>Water source boundaries</b>	The main waterbody is Lake George with headwater streams flowing into it. Lake George is a sink and there is no surface flow out of the system.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station "Turallo Creek at Bungendore" (411002).</p> <p>The flow sequence extends from 24/09/1971 to 18/01/1980, 8.3 years in total. 28.5% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 2.10.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 332 ML made up of:</p> <ul style="list-style-type: none"> <li>• 391.5 ML Unregulated category entitlement</li> <li>• 12 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 6.53 ML/day was available for irrigation and 0.03 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Moderate

<b>Water source and model</b>	<b>Lake George: model Lake George</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Bredbo” (410_07) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 96%</li> <li>• Vegetables 4%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Lake George system was estimated to be 65ha.</p> <p>The weather station used was Bungendore Post Office (station number 70011).</p> <p>The crop factor file used was “sthtab6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	

Table 142. Lower Billabong

<b>Water source and model</b>	<b>Lower Billabong: model Billabong Creek</b>	
<b>Water source boundaries</b>	The main stream is Billabong Creek downstream of other water sources that flow into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Billabong Creek at Cocketgedong” (410012).</p> <p>The flow sequence extends from 02/01/1916 to 17/11/2015, 99.9 years in total. 15.3% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,630 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,563 ML Unregulated category entitlement</li> <li>• 67 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 49ML/day, which simulated a CtP at the end of the system.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 26.05 ML/day was available for irrigation and 0.18 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Lower Billabong: model Billabong Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Lower Billabong” (409_07) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 37%</li> <li>• Citrus 4%</li> <li>• Lucerne 6%</li> <li>• Perennial pasture 23%</li> <li>• Wheat 21%</li> <li>• Rice 9%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Billabong Creek system was estimated to be 619ha.</p> <p>The weather station used was Walbundrie (Crediton Street) (station number 74115).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.</p>

Table 143. Murrumbidgee River I

<b>Water source and model</b>	<b>Murrumbidgee I: model Murrumbidgee River</b>
<b>Water source boundaries</b>	The main stream is the Murrumbidgee River downstream of other water sources that flow into it.
<b>Assumptions</b>	<b>Confidence</b>
<b>Flow sequence</b>	Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Murrumbidgee River at Mittagang Crossing” (410033).</p> <p>The flow sequence extends from 28/03/1926 to 20/01/2011, 84.8 years in total. 80.0% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>
<b>total area factor</b>	The flow sequence was factored for area by 1.02.
<b>on-river dams area factor</b>	No on-river dam simulated.
<b>on-farm dams area factor</b>	No on-farm dams simulated.
<b>Water access</b>	High
<b>level of entitlement</b>	<p>The total entitlement simulated was 4,541 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,752.5 ML Unregulated category entitlement</li> <li>• 654.5 ML Domestic and Stock category</li> <li>• 2,134 ML LWU category entitlement</li> </ul>
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 33ML/day, which simulated a CtP at the end of the system.
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.
<b>pump capacity</b>	A pump capacity of 29.21 ML/day was available for irrigation and 7.64 ML/day was available for Stock and Domestic and LWU water extraction.
<b>on-river dam access</b>	No on-river dams simulated.
<b>on-farm storage available</b>	No on-farm storage simulated.
<b>Irrigation pattern</b>	High

<b>Water source and model</b>	<b>Murrumbidgee I: model Murrumbidgee River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. <b>level of entitlement</b>	<p>The total entitlement simulated was 7 ML made up of:</p> <ul style="list-style-type: none"> <li>7 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 1ML/day, which simulated a CtP at the end of the system.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 0.12ML/day was available for irrigation and 0.02ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>	Moderate	

<b>Water source and model</b>	<b>Mountain: model Mountain Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Upper Billabong” (409_19) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 65%</li> <li>• Summer Maize 35%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Mountain Creek system was estimated to be 1ha.</p> <p>The weather station used was Holbrook (RSL) (station number 72022).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.

Table 152. Ten Mile Creek

<b>Water source and model</b>	<b>Ten Mile: model Ten Mile Creek</b>	
<b>Water source boundaries</b>	The main stream is Ten Mile Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at a gauging station from an adjacent catchment "Mountain Creek at Thomond North" (410096).</p> <p>The flow sequence extends from 21/11/1967 to 04/01/1994, 26.1 years in total. 3.1% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.54.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 0 ML made up of:</p> <ul style="list-style-type: none"> <li>7 ML Unregulated category entitlement</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold on the irrigation pumps of 1ML/day, which simulated a CtP at the end of the system.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 0.12 ML/day was available for irrigation and 0.00 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Moderate

<b>Water source and model</b>	<b>Ten Mile: model Ten Mile Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Upper Billabong” (409_19) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 65%</li> <li>• Summer Maize 35%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Ten Mile Creek system was estimated to be 1ha.</p> <p>The weather station used was Holbrook (RSL) (station number 72022).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.</p>

Table 153. Upper Billabong

<b>Water source and model</b>	<b>Upper Billabong: model upper reaches of Billabong Creek</b>	
<b>Water source boundaries</b>	The main stream is upper reaches of Billabong Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Billabong Creek at Aberfeldy” (410097).</p> <p>The flow sequence extends from 23/11/1967 to 27/11/2011, 44.0 years in total. 8.0% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.02.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 337 ML made up of:</p> <ul style="list-style-type: none"> <li>• 330 ML Unregulated category entitlement</li> <li>• 7 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP of 1.84 ML/day was not simulated as the CtP is expected not to be implemented.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 5.50 ML/day was available for irrigation and 0.02 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Upper Billabong: model upper reaches of Billabong Creek</b>
crop	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Upper Billabong” (409_19) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 65%</li> <li>• Summer Maize 35%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the upper reaches of Billabong Creek system was estimated to be 49.4ha.</p> <p>The weather station used was Holbrook (Glenfalloch) (station number 72019).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	

Table 154. Urana

<b>Water source and model</b>	<b>Urana: model Lake Urana</b>	
<b>Water source boundaries</b>	The main waterbody is Lake Urana with headwater streams flowing into it. The lake is fed by the Urangeline Creek system.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at a gauging station from an adjacent catchment “Bullenbung Creek at Above Old Man Creek” (410087).</p> <p>The flow sequence extends from 16/03/1959 to 31/12/1972, 13.8 years in total. 5.2% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 4.40.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 403 ML made up of:</p> <ul style="list-style-type: none"> <li>• 229 ML Unregulated category entitlement</li> <li>• 174 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 3.82 ML/day was available for irrigation and 0.48 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Urana: model Lake Urana</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Urana” (409_21) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Perennial pasture 50%</li> <li>• Summer Maize 50%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Lake Urana system was estimated to be 36.6 ha.</p> <p>The weather station used was Urana Post Office (station number 74110).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>

<b>Licence locations</b>	

## Murray unregulated river models

Table 156. Albury

<b>Water source and model</b>	<b>Albury: model Dead Mans, Splitters, Bungambrawatha, and Eight Mile Creeks</b>	
<b>Water source boundaries</b>	The main streams are Dead Mans, Splitters, Bungambrawatha, and Eight Mile Creeks, which flow into the regulated river.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at a gauging station from an adjacent catchment “Bowna Creek at Yambla” (401015).</p> <p>The flow sequence extends from 18/12/1973 to 28/07/2011, 37.6 years in total. 0.5% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 0.83. Of this factor 25 was not available to be accessed by licence holders.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 405 ML made up of:</p> <ul style="list-style-type: none"> <li>• 352 ML Unregulated category entitlement</li> <li>• 53 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 5.87 ML/day was available for irrigation and 0.15 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Low

<b>Water source and model</b>	<b>Albury: model Dead Mans, Splitters, Bungambrawatha, and Eight Mile Creeks</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Jingellic” (409_12) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 34%</li> <li>• Fababean 33%</li> <li>• Soybeans 33%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Dead Mans, Splitters, Bungambrawatha, and Eight Mile Creeks system was estimated to be 301ha.</p> <p>The weather station used was Albury Pumping Station (station number 72097).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions indentified as impacting on streamflow.
<b>Licence locations</b>	

Table 157. Hume

<b>Water source and model</b>	<b>Hume: model Bowna Creek and a number of smaller creeks flowing in the Hume Weir</b>	
<b>Water source boundaries</b>	The main streams are Bowna Creek and a number of smaller creeks flowing in the Hume Weir. It only includes the NSW stream north of the storage.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station "Bowna Creek at Yambla" (401015).</p> <p>The flow sequence extends from 18/12/1973 to 28/07/2011, 37.6 years in total. 0.5% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 2.54. Of this factor 116 was not available to be accessed by licence holders.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 715 ML made up of:</p> <ul style="list-style-type: none"> <li>• 676 ML Unregulated category entitlement</li> <li>• 39 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 11.27 ML/day was available for irrigation and 0.11 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Low

<b>Water source and model</b>	<b>Hume: model Bowna Creek and a number of smaller creeks flowing in the Hume Weir</b>
crop	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Jingellic” (409_12) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 34%</li> <li>• Fababean 33%</li> <li>• Soybeans 33%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Bowna Creek and a number of smaller creeks flowing in the Hume Weir system was estimated to be 578ha.</p> <p>The weather station used was Jindera Post Office (station number 74056).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	

Table 158. Indi

<b>Water source and model</b>	<b>Indi: model Murray River upstream of the confluence with Swampy Plain River</b>	
<b>Water source boundaries</b>	The main stream is the Murray River upstream of the confluence with Swampy Plain River with headwater streams flowing into it. It only includes the NSW headwater stream north of the Murray River.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station "Murray River at Biggara" (401012).</p> <p>The flow sequence extends from 22/07/1948 to 22/10/2011, 63.2 years in total. 0.2% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.08.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 2,222 ML made up of:</p> <ul style="list-style-type: none"> <li>• 2,215 ML Unregulated category entitlement</li> <li>• 7 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold (in a decision table) on the inflow above the irrigation pumps of 87 ML/day.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 36.92 ML/day was available for irrigation and 0.02 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Indi: model Murray River upstream of the confluence with Swampy Plain River</b>
crop	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Indi” (409_01) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 18%</li> <li>• Lucerne 1%</li> <li>• Perennial pasture 18%</li> <li>• Intensive Perennial Pasture 63%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Murray River upstream of the confluence with Swampy Plain River system was estimated to be 366ha.</p> <p>The weather station used was Khancoban Smhea (station number 72060).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	The CtP is triggered at a location above the majority of the irrigation pumps, hence it is simulated as if all pumps are below the trigger point.

Table 159. Jingellic

<b>Water source and model</b>	<b>Jingellic: model Jingellic Creek</b>	
<b>Water source boundaries</b>	The main stream is Jingellic Creek with headwater streams flowing into it. There also a smaller tributary Horse Creek in the water source.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Jingellic Creek at Jingellic” (401013).</p> <p>The flow sequence extends from 13/07/1965 to 23/11/2011, 46.4 years in total. 1.9% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.23. Of this factor 20 was not available to be accessed by licence holders.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 249 ML made up of:</p> <ul style="list-style-type: none"> <li>• 240 ML Unregulated category entitlement</li> <li>• ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold (in a decision table) on the inflow above the irrigation pumps of 10 ML/day.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 4.00ML/day was available for irrigation and 0.02ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Jingellic: model Jingellic Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Jingellic” (409_12) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 34%</li> <li>• Fababean 33%</li> <li>• Soybeans 33%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Jingellic Creek system was estimated to be 205ha.</p> <p>The weather station used was Walwa (station number 82052).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location above the majority of the irrigation pumps, hence it is simulated as if all pumps are below the trigger point.</p>

Table 160. Majors Creek

<b>Water source and model</b>	<b>Majors: model Majors Creek</b>	
<b>Water source boundaries</b>	The main stream is Majors Creek with headwater streams flowing into it. Part of the lower end of the water source has some small residual streams flowing into the trunk stream.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Low
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at a gauging station from an adjacent catchment "Bowna Creek at Yambla" (401015).</p> <p>The flow sequence extends from 18/12/1973 to 28/07/2011, 37.6 years in total. 0.5% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 0.55.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (2% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 81 ML made up of:</p> <ul style="list-style-type: none"> <li>• 76 ML Unregulated category entitlement</li> <li>• 5 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 1.27 ML/day was available for irrigation and 0.01 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>50 ML of on-river dam capacity was simulated. 100% of the unregulated entitlement had access to on-river dams.</p> <p>100% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Low

<b>Water source and model</b>	<b>Majors: model Majors Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Jingellic” (409_12) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 34%</li> <li>• Fababean 33%</li> <li>• Soybeans 33%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Majors Creek system was estimated to be 65ha.</p> <p>The weather station used was Howlong Post Office (station number 74054).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 161. Mannus

<b>Water source and model</b>	<b>Mannus: model Mannus Creek</b>	
<b>Water source boundaries</b>	The main stream is Mannus Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Mannus Creek at Tooma” (401008).</p> <p>The flow sequence extends from 01/12/1947 to 24/10/2011, 63.9 years in total. 27.9% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.03.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (1% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 1671 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,655 ML Unregulated category entitlement</li> <li>• 16 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold (in a decision table) on the inflow above the irrigation pumps of (used a equivalent trigger of 17.9 ML/day due to flow factoring) 9.4 ML/day.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 27.58 ML/day was available for irrigation and 0.04 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>50 ML of on-river dam capacity was simulated. 3% of the unregulated entitlement had access to on-river dams.</p> <p>0% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Mannus: model Mannus Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Mannus” (409_15) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 2%</li> <li>• Orchard 9%</li> <li>• Perennial pasture 1%</li> <li>• Intensive Perennial Pasture 36%</li> <li>• Grapes 52%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Mannus Creek system was estimated to be 324ha.</p> <p>The weather station used was Brookfield Forest Station (station number 72009).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions identified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location above the majority of the irrigation pumps, hence it is simulated as if all pumps are below the trigger point.</p> <p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 162. Maragle

<b>Water source and model</b>	<b>Maragle: model Maragle Creek</b>	
<b>Water source boundaries</b>	The main stream is Maragle Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Maragle Creek at Maragle” (401009).</p> <p>The flow sequence extends from 02/12/1947 to 23/11/2011, 64.0 years in total. 1.7% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.15.	
<b>on-river dams area factor</b>	A proportion of the streamflow sequence (3% of the unfactored flow sequence) is able to be captured by on-river dams.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 411 ML made up of:</p> <ul style="list-style-type: none"> <li>• 402 ML Unregulated category entitlement</li> <li>• 9 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold (in a decision table) on the end of system flow below the irrigation pumps of (used a equivalent trigger of 11.2ML/day due to flow factoring) 10 ML/day.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 6.70 ML/day was available for irrigation and 0.02 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	<p>69 ML of on-river dam capacity was simulated. 15% of the unregulated entitlement had access to on-river dams.</p> <p>78% of the Stock and Domestic and LWU entitlement had access to the on-river dams.</p>	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		High

<b>Water source and model</b>	<b>Maragle: model Maragle Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Maragle” (409_16) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 6%</li> <li>• Pecans 2%</li> <li>• Perennial pasture 6%</li> <li>• Turf 4%</li> <li>• Grapes 82%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Maragle Creek system was estimated to be 109ha.</p> <p>The weather station used was Maragle Station (station number 72033).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions identified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location below the majority of the irrigation pumps, hence it is simulated as if all pumps are above the trigger point.</p> <p>Some of the licences have access to on-river dams (see sections 'on-river dam area factor' and 'on-river dam access').</p>

Table 163. Ournie Welaregang

<b>Water source and model</b>	<b>Ournie Welaregang: model Ournie Creek, and Spring Creek</b>	
<b>Water source boundaries</b>	The main streams are Ournie Creek, and Spring Creek.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at a gauging station from an adjacent catchment "Welumba Creek at The Square" (401016).</p> <p>The flow sequence extends from 16/06/1983 to 24/10/2011, 28.4 years in total. 5.6% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 2.68. Of this factor 1.99 was not available to be accessed by licence holders.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 13 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1 ML Unregulated category entitlement</li> <li>• 12 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 0.02ML/day was available for irrigation and 0.03ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Low

<b>Water source and model</b>	<b>Ournie Welaregang: model Ournie Creek, and Spring Creek</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Jingellic” (409_12) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Annual pasture 34%</li> <li>• Fababean 33%</li> <li>• Soybeans 33%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Ournie Creek, and Spring Creek system was estimated to be 1ha.</p> <p>The weather station used was Walwa (station number 82052).</p> <p>The crop factor file used was “sthwt6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	

Table 164. Swampy Plain

<b>Water source and model</b>	<b>Swampy Plain: model Swampy Plain River upstream of Khancoban Pondage</b>	
<b>Water source boundaries</b>	The main stream is the Swampy Plain River upstream of Khancoban Pondage with headwater streams flowing into it. Part of the lower end of the water source has some small residual streams flowing into the trunk stream.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		Moderate
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Swampy Plain River at Khancoban” (401501).</p> <p>The flow sequence extends from 07/12/1926 to 31/12/1965, 39.1 years in total. 1.5% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.44. Of this factor 1.13 was not available to be accessed by licence holders.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		High
<b>level of entitlement</b>	<p>The total entitlement simulated was 290 ML made up of:</p> <ul style="list-style-type: none"> <li>• 129 ML Unregulated category entitlement</li> <li>• 21 ML Domestic and Stock category</li> <li>• 140 ML LWU category entitlement</li> </ul>	
<b>access rules (CtP)</b>	A CtP was not simulated.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 2.15 ML/day was available for irrigation and 0.44ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Low

<b>Water source and model</b>	<b>Swampy Plain: model Swampy Plain River upstream of Khancoban Pondage</b>
crop	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Mannus” (409_15) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 2%</li> <li>• Orchard 9%</li> <li>• Perennial pasture 1%</li> <li>• Intensive Perennial Pasture 36%</li> <li>• Grapes 52%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Swampy Plain River upstream of Khancoban Pondage system was estimated to be 25ha.</p> <p>The weather station used was Khancoban Smhea (station number 72060).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	No substantial alluvial extractions identified as impacting on streamflow.
<b>Licence locations</b>	

Table 165. Tooma

<b>Water source and model</b>	<b>Tooma: model Tooma River</b>	
<b>Water source boundaries</b>	The main stream is the Tooma River downstream of other water sources that flow into it.	
<b>Assumptions</b>		<b>Confidence</b>
<b>Flow sequence</b>		High
<b>flows used</b>	<p>A measured flow sequence was used to represent the streamflow available to be extracted. This flow was measured at the gauging station “Tooma River at Pinegrove” (401014).</p> <p>The flow sequence extends from 08/08/1955 to 25/10/2011, 56.2 years in total. 24.4% of the measured sequenced need to be filled using a correlation with a nearby gauging station.</p>	
<b>total area factor</b>	The flow sequence was factored for area by 1.00.	
<b>on-river dams area factor</b>	No on-river dam simulated.	
<b>on-farm dams area factor</b>	No on-farm dams simulated.	
<b>Water access</b>		Moderate
<b>level of entitlement</b>	<p>The total entitlement simulated was 1,397 ML made up of:</p> <ul style="list-style-type: none"> <li>• 1,390 ML Unregulated category entitlement</li> <li>• 7 ML Domestic and Stock category</li> </ul>	
<b>access rules (CtP)</b>	The CtP was simulated by placing a threshold (in a decision table) on the inflow above the irrigation pumps of 79 ML/day.	
<b>higher access rule (CtP on Approval)</b>	No higher of access rules (CtP) were simulated.	
<b>pump capacity</b>	A pump capacity of 74.00 ML/day was available for irrigation and 1.60 ML/day was available for Stock and Domestic and LWU water extraction.	
<b>on-river dam access</b>	No on-river dams simulated.	
<b>on-farm storage available</b>	No on-farm storage simulated.	
<b>Irrigation pattern</b>		Moderate

<b>Water source and model</b>	<b>Tooma: model Tooma River</b>
<b>crop</b>	<p>The crop mix assumed is from the survey for a conversion of unregulated licences carried out in 2000. The crop survey result for Stressed Rivers Assessment unit “Tumbarumba” (409_03) was used. This crop mix is represented by simulating the water demands of the following crops:</p> <ul style="list-style-type: none"> <li>• Lucerne 20%</li> <li>• Orchard 32%</li> <li>• Perennial pasture 13%</li> <li>• Intensive Perennial Pasture 21%</li> <li>• Summer Maize 12%</li> <li>• Turf 2%</li> </ul> <p>The total area irrigated (based on the full development of the entitlement) in the Tooma River system was estimated to be 665ha.</p> <p>The weather station used was Maragle Station (station number 72033).</p> <p>The crop factor file used was “sthwst6ed.crp”, which was developed for the licence conversion process.</p>
<b>Groundwater extraction</b>	<p>No substantial alluvial extractions indentified as impacting on streamflow.</p>
<b>Licence locations</b>	<p>The CtP is triggered at a location above the majority of the irrigation pumps, hence it is simulated as if all pumps are below the trigger point.</p>

Table 166. Tumbarumba

<b>Water source and model</b>	<b>Tumbarumba: model Tumbarumba Creek</b>	
<b>Water source boundaries</b>	The main stream is Tumbarumba Creek with headwater streams flowing into it.	
<b>Assumptions</b>		<b>Confidence</b>

**Table 169. Legend for functions**

Number	Key ecosystem functions (KEF)
0	none
1	Disturbance through cease-to-flow periods
2	Disturbance and wetting through bankfull and overbank flows
3	Provide wetted habitat diversity in pool environments
4	Provide wetted habitat diversity in riffle and run environments
5	Provide appropriate wetted habitat heterogeneity within a reach (creation of diverse hydraulic features)
6	Provide in-channel habitat features within a reach (point bars and benches)
7	Organic and inorganic sediment delivery to downstream reaches (debris flows, scouring, flushing of fine sediments)
8	Sediment delivery to and from floodplains (floodplains, benches)
9	Dilute carbon and nutrients from litter and soil on the floodplain that has been returned to the river systems
10	Dispersal of aquatic communities (including drift)
11	Recolonisation of aquatic fauna and flora communities
12	Migration to fulfil requirements of life-history stages (e.g. diadromous fish species)
13	Foraging of aquatic species
14	Instream primary production by periphyton, phytoplankton and biofilms
